The screenshot displays a Jupyter Notebook interface. At the top, the title bar reads 'Jupyter Running Code' with a subtext 'Last Checkpoint: 10 months ago'. Below this is a menu bar with 'File', 'Edit', 'View', 'Run', 'Kernel', 'Settings', and 'Help'. A toolbar contains icons for saving, opening, running, and other actions. The main content area is titled 'Running Code' and contains the following text:

First and foremost, the Jupyter Notebook is an interactive environment for writing and running code. The notebook is capable of running code in a wide range of languages. However, each notebook is associated with a single kernel. This notebook is associated with the IPython kernel, therefore runs Python code.

**Code cells allow you to enter and run code**

Run a code cell using `Shift-Enter` or pressing the  button in the toolbar above:

```
[1]: a = 10
```

```
[2]: print(a)
```

10

There are two other keyboard shortcuts for running code:

- `Alt-Enter` runs the current cell and inserts a new one below.
- `Ctrl-Enter` run the current cell and enters command mode.

**Managing the Kernel**

Code is run in a separate process called the Kernel. The Kernel can be interrupted or restarted. Try running the following cell and then hit the  button in the toolbar above.

```
[3]: import time
time.sleep(10)
```

If the Kernel dies you will be prompted to restart it. Here we call the low-level system `libc.time` routine with the wrong argument via `ctypes` to segfault the Python interpreter:

- [Installation](#)
- [Starting the Notebook](#)

## USER DOCUMENTATION

### 1.1 The Jupyter Notebook

#### 1.1.1 Introduction

The notebook extends the console-based approach to interactive computing in a qualitatively new direction, providing a web-based application suitable for capturing the whole computation process: developing, documenting, and executing code, as well as communicating the results. The Jupyter notebook combines two components:

**A web application:** a browser-based tool for interactive authoring of documents which combine explanatory text, mathematics, computations and their rich media output.

**Notebook documents:** a representation of all content visible in the web application, including inputs and outputs of the computations, explanatory text, mathematics, images, and rich media representations of objects.

**See also:**

See the [installation guide](#) on how to install the notebook and its dependencies.

#### Main features of the web application

- In-browser editing for code, with automatic syntax highlighting, indentation, and tab completion/introspection.
- The ability to execute code from the browser, with the results of computations attached to the code which generated them.
- Displaying the result of computation using rich media representations, such as HTML, LaTeX, PNG, SVG, etc. For example, publication-quality figures rendered by the [matplotlib](#) library, can be included inline.
- In-browser editing for rich text using the [Markdown](#) markup language, which can provide commentary for the code, is not limited to plain text.
- The ability to easily include mathematical notation within markdown cells using LaTeX, and rendered natively by [MathJax](#).

### Notebook documents

Notebook documents contains the inputs and outputs of an interactive session as well as additional text that accompanies the code but is not meant for execution. In this way, notebook files can serve as a complete computational record of a session, interleaving executable code with explanatory text, mathematics, and rich representations of resulting objects. These documents are internally **JSON** files and are saved with the `.ipynb` extension. Since JSON is a plain text format, they can be version-controlled and shared with colleagues.

Notebooks may be exported to a range of static formats, including HTML (for example, for blog posts), reStructuredText, LaTeX, PDF, and slide shows, via the `nbconvert` command.

Furthermore, any `.ipynb` notebook document available from a public URL can be shared via the Jupyter Notebook Viewer `<nbviewer>`. This service loads the notebook document from the URL and renders it as a static web page. The results may thus be shared with a colleague, or as a public blog post, without other users needing to install the Jupyter notebook themselves. In effect, nbviewer is simply `nbconvert` as a web service, so you can do your own static conversions with `nbconvert`, without relying on nbviewer.

**See also:**

[Details on the notebook JSON file format](#)

### Notebooks and privacy

Because you use Jupyter in a web browser, some people are understandably concerned about using it with sensitive data. However, if you followed the standard [install instructions](#), Jupyter is actually running on your own computer. If the URL in the address bar starts with `http://localhost:` or `http://127.0.0.1:`, it's your computer acting as the server. Jupyter doesn't send your data anywhere else—and as it's open source, other people can check that we're being honest about this.

You can also use Jupyter remotely: your company or university might run the server for you, for instance. If you want to work with sensitive data in those cases, talk to your IT or data protection staff about it.

We aim to ensure that other pages in your browser or other users on the same computer can't access your notebook server. See the [security documentation](#) for more about this.

### 1.1.2 Starting the notebook server

You can start running a notebook server from the command line using the following command:

```
jupyter notebook
```

This will print some information about the notebook server in your console, and open a web browser to the URL of the web application (by default, `http://127.0.0.1:8888`).

The landing page of the Jupyter notebook web application, the **dashboard**, shows the notebooks currently available in the notebook directory (by default, the directory from which the notebook server was started).

You can create new notebooks from the dashboard with the **New Notebook** button, or open existing ones by clicking on their name. You can also drag and drop `.ipynb` notebooks and standard `.py` Python source code files into the notebook list area.

When starting a notebook server from the command line, you can also open a particular notebook directly, bypassing the dashboard, with `jupyter notebook my_notebook.ipynb`. The `.ipynb` extension is assumed if no extension is given.

When you are inside an open notebook, the *File | Open...* menu option will open the dashboard in a new browser tab, to allow you to open another notebook from the notebook directory or to create a new notebook.

**Note:** You can start more than one notebook server at the same time, if you want to work on notebooks in different directories. By default the first notebook server starts on port 8888, and later notebook servers search for ports near that one. You can also manually specify the port with the `--port` option.

---

## Creating a new notebook document

A new notebook may be created at any time, either from the dashboard, or using the *File* → *New* menu option from within an active notebook. The new notebook is created within the same directory and will open in a new browser tab. It will also be reflected as a new entry in the notebook list on the dashboard.

## Opening notebooks

An open notebook has **exactly one** interactive session connected to a kernel, which will execute code sent by the user and communicate back results. This kernel remains active if the web browser window is closed, and reopening the same notebook from the dashboard will reconnect the web application to the same kernel. In the dashboard, notebooks with an active kernel have a *Shutdown* button next to them, whereas notebooks without an active kernel have a *Delete* button in its place.

Other clients may connect to the same kernel. When each kernel is started, the notebook server prints to the terminal a message like this:

```
[JupyterNotebookApp] Kernel started: 87f7d2c0-13e3-43df-8bb8-1bd37aaf3373
```

This long string is the kernel's ID which is sufficient for getting the information necessary to connect to the kernel. If the notebook uses the IPython kernel, you can also see this connection data by running the `%connect_info` magic, which will print the same ID information along with other details.

You can then, for example, manually start a Qt console connected to the *same* kernel from the command line, by passing a portion of the ID:

```
$ jupyter qtconsole --existing 87f7d2c0
```

Without an ID, `--existing` will connect to the most recently started kernel.

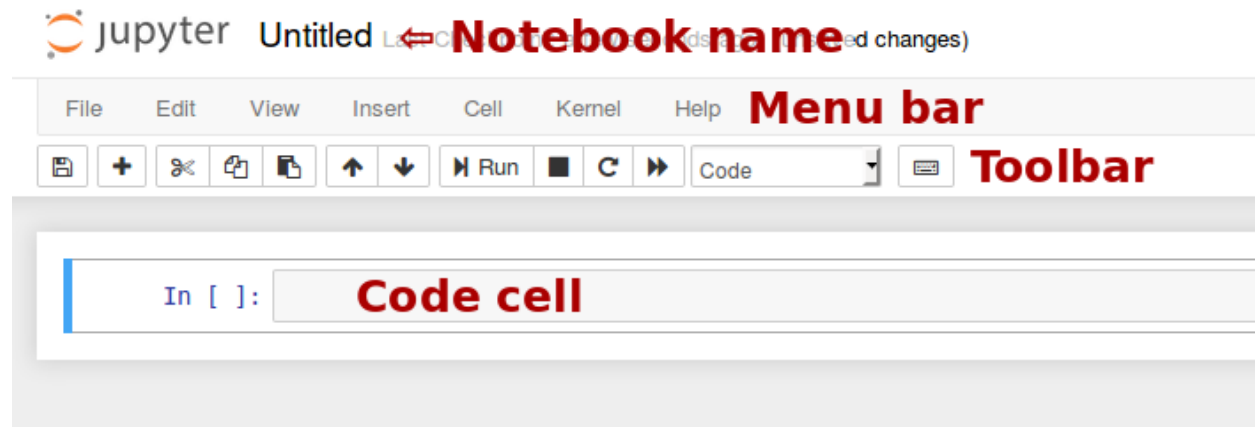

With the IPython kernel, you can also run the `%qtconsole` magic in the notebook to open a Qt console connected to the same kernel.

**See also:**

[Decoupled two-process model](#)

## 1.1.3 Notebook user interface

When you create a new notebook document, you will be presented with the **notebook name**, a **menu bar**, a **toolbar** and an empty **code cell**.

**Notebook name:** The name displayed at the top of the page, next to the Jupyter logo, reflects the name of the `.ipynb` file. Clicking on the notebook name brings up a dialog which allows you to rename it. Thus, renaming a notebook from “Untitled0” to “My first notebook” in the browser, renames the `Untitled0.ipynb` file to `My first notebook.ipynb`.

**Menu bar:** The menu bar presents different options that may be used to manipulate the way the notebook functions.

**Toolbar:** The tool bar gives a quick way of performing the most-used operations within the notebook, by clicking on an icon.

**Code cell:** the default type of cell; read on for an explanation of cells.

### 1.1.4 Structure of a notebook document

The notebook consists of a sequence of cells. A cell is a multiline text input field, and its contents can be executed by using `Shift-Enter`, or by clicking either the “Play” button the toolbar, or *Cell, Run* in the menu bar. The execution behavior of a cell is determined by the cell’s type. There are three types of cells: **code cells**, **markdown cells**, and **raw cells**. Every cell starts off being a **code cell**, but its type can be changed by using a drop-down on the toolbar (which will be “Code”, initially), or via *keyboard shortcuts*.

For more information on the different things you can do in a notebook, see the [collection of examples](#).

#### Code cells

A *code cell* allows you to edit and write new code, with full syntax highlighting and tab completion. The programming language you use depends on the *kernel*, and the default kernel (IPython) runs Python code.

When a code cell is executed, code that it contains is sent to the kernel associated with the notebook. The results that are returned from this computation are then displayed in the notebook as the cell’s *output*. The output is not limited to text, with many other possible forms of output are also possible, including `matplotlib` figures and HTML tables (as used, for example, in the `pandas` data analysis package). This is known as IPython’s *rich display* capability.

**See also:**

[Rich Output example notebook](#)

## Markdown cells

You can document the computational process in a literate way, alternating descriptive text with code, using *rich text*. In IPython this is accomplished by marking up text with the Markdown language. The corresponding cells are called *Markdown cells*. The Markdown language provides a simple way to perform this text markup, that is, to specify which parts of the text should be emphasized (italics), bold, form lists, etc.

If you want to provide structure for your document, you can use markdown headings. Markdown headings consist of 1 to 6 hash # signs # followed by a space and the title of your section. The markdown heading will be converted to a clickable link for a section of the notebook. It is also used as a hint when exporting to other document formats, like PDF.

When a Markdown cell is executed, the Markdown code is converted into the corresponding formatted rich text. Markdown allows arbitrary HTML code for formatting.

Within Markdown cells, you can also include *mathematics* in a straightforward way, using standard LaTeX notation:  $...$  for inline mathematics and 
$$...$$
 for displayed mathematics. When the Markdown cell is executed, the LaTeX portions are automatically rendered in the HTML output as equations with high quality typography. This is made possible by [MathJax](#), which supports a [large subset](#) of LaTeX functionality

Standard mathematics environments defined by LaTeX and AMS-LaTeX (the `amsmath` package) also work, such as `\begin{equation}...\end{equation}`, and `\begin{align}...\end{align}`. New LaTeX macros may be defined using standard methods, such as `\newcommand`, by placing them anywhere *between math delimiters* in a Markdown cell. These definitions are then available throughout the rest of the IPython session.

**See also:**

[Working with Markdown Cells](#) example notebook

## Raw cells

*Raw* cells provide a place in which you can write *output* directly. Raw cells are not evaluated by the notebook. When passed through `nbconvert`, raw cells arrive in the destination format unmodified. For example, you can type full LaTeX into a raw cell, which will only be rendered by LaTeX after conversion by `nbconvert`.

### 1.1.5 Basic workflow

The normal workflow in a notebook is, then, quite similar to a standard IPython session, with the difference that you can edit cells in-place multiple times until you obtain the desired results, rather than having to rerun separate scripts with the `%run` magic command.

Typically, you will work on a computational problem in pieces, organizing related ideas into cells and moving forward once previous parts work correctly. This is much more convenient for interactive exploration than breaking up a computation into scripts that must be executed together, as was previously necessary, especially if parts of them take a long time to run.

To interrupt a calculation which is taking too long, use the *Kernel, Interrupt* menu option, or the `i, i` keyboard shortcut. Similarly, to restart the whole computational process, use the *Kernel, Restart* menu option or `0, 0` shortcut.

A notebook may be downloaded as a `.ipynb` file or converted to a number of other formats using the menu option *File, Download as*.

**See also:**

[Running Code in the Jupyter Notebook](#) example notebook

[Notebook Basics](#) example notebook

## Keyboard shortcuts

All actions in the notebook can be performed with the mouse, but keyboard shortcuts are also available for the most common ones. The essential shortcuts to remember are the following:

- **Shift-Enter: run cell** Execute the current cell, show any output, and jump to the next cell below. If Shift-Enter is invoked on the last cell, it makes a new cell below. This is equivalent to clicking the *Cell, Run* menu item, or the Play button in the toolbar.
- **Esc: Command mode** In command mode, you can navigate around the notebook using keyboard shortcuts.
- **Enter: Edit mode** In edit mode, you can edit text in cells.

For the full list of available shortcuts, click *Help, Keyboard Shortcuts* in the notebook menus.

### 1.1.6 Plotting

One major feature of the Jupyter notebook is the ability to display plots that are the output of running code cells. The IPython kernel is designed to work seamlessly with the [matplotlib](#) plotting library to provide this functionality. Specific plotting library integration is a feature of the kernel.

### 1.1.7 Installing kernels

For information on how to install a Python kernel, refer to the [IPython install page](#).

The Jupyter wiki has a long list of [Kernels for other languages](#). They usually come with instructions on how to make the kernel available in the notebook.

### 1.1.8 Trusting Notebooks

To prevent untrusted code from executing on users' behalf when notebooks open, we store a signature of each trusted notebook. The notebook server verifies this signature when a notebook is opened. If no matching signature is found, Javascript and HTML output will not be displayed until they are regenerated by re-executing the cells.

Any notebook that you have fully executed yourself will be considered trusted, and its HTML and Javascript output will be displayed on load.

If you need to see HTML or Javascript output without re-executing, and you are sure the notebook is not malicious, you can tell Jupyter to trust it at the command-line with:

```
$ jupyter trust mynotebook.ipynb
```

See the [security documentation](#) for more details about the trust mechanism.

### 1.1.9 Browser Compatibility

The Jupyter Notebook aims to support the latest versions of these browsers:

- Chrome
- Safari
- Firefox

Up to date versions of Opera and Edge may also work, but if they don't, please use one of the supported browsers.

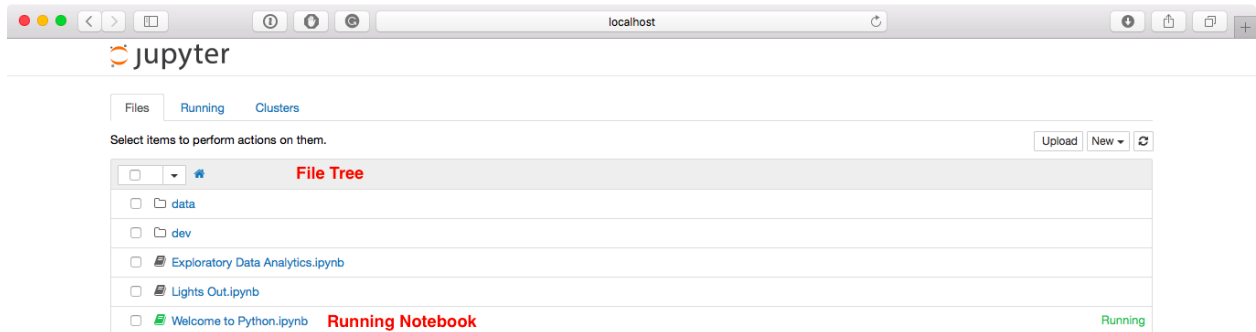

Using Safari with HTTPS and an untrusted certificate is known to not work (websockets will fail).

## 1.2 User interface components

When opening bug reports or sending emails to the Jupyter mailing list, it is useful to know the names of different UI components so that other developers and users have an easier time helping you diagnose your problems. This section will familiarize you with the names of UI elements within the Notebook and the different Notebook modes.

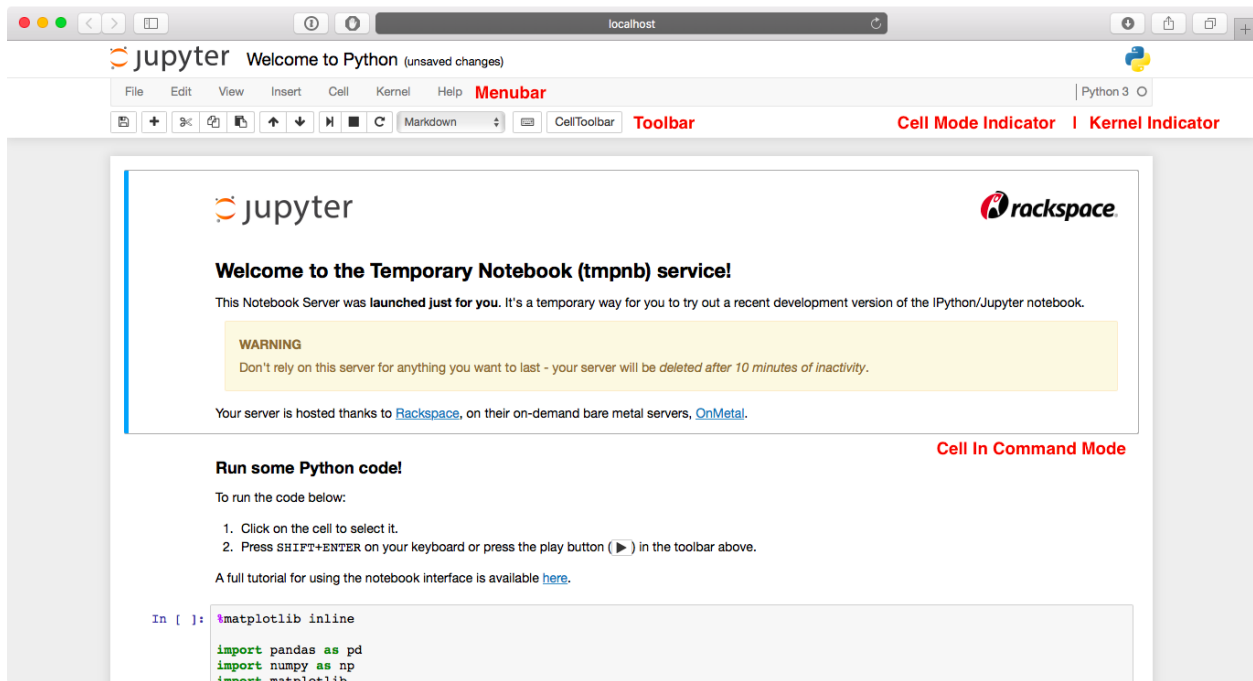

### 1.2.1 Notebook Dashboard

When you launch `jupyter notebook` the first page that you encounter is the Notebook Dashboard.

### 1.2.2 Notebook Editor

Once you've selected a Notebook to edit, the Notebook will open in the Notebook Editor.

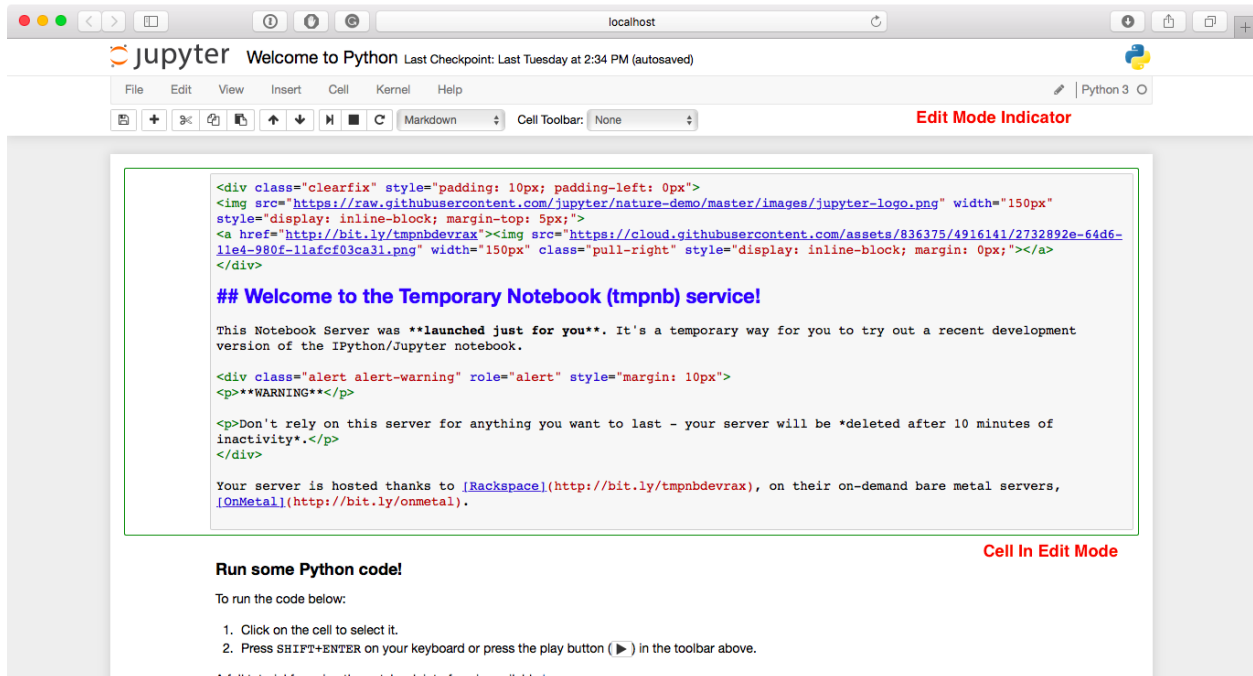

### 1.2.3 Interactive User Interface Tour of the Notebook

If you would like to learn more about the specific elements within the Notebook Editor, you can go through the user interface tour by selecting *Help* in the menubar then selecting *User Interface Tour*.

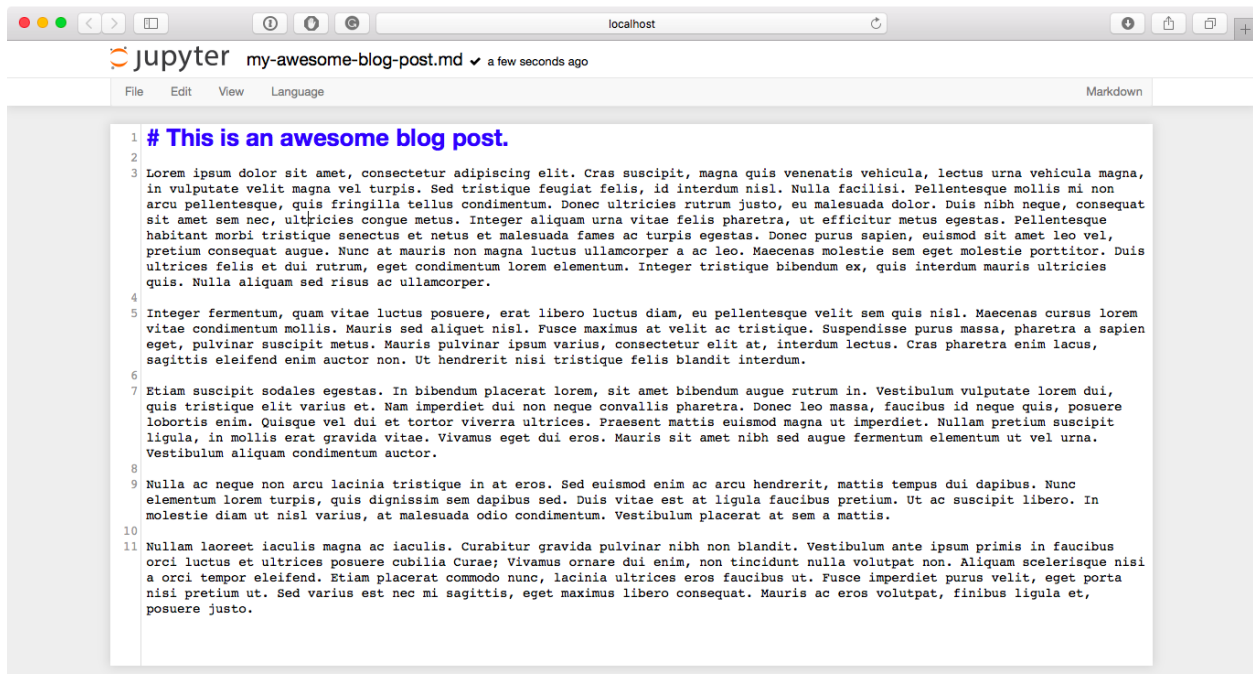

#### Edit Mode and Notebook Editor

When a cell is in edit mode, the Cell Mode Indicator will change to reflect the cell's state. This state is indicated by a small pencil icon on the top right of the interface. When the cell is in command mode, there is no icon in that location.

## 1.2.4 File Editor

Now let's say that you've chosen to open a Markdown file instead of a Notebook file whilst in the Notebook Dashboard. If so, the file will be opened in the File Editor.

## 1.3 Notebook Examples

The pages in this section are all converted notebook files. You can also [view these notebooks on nbviewer](#).

### 1.3.1 What is the Jupyter Notebook?

#### Introduction

The Jupyter Notebook is an **interactive computing environment** that enables users to author notebook documents that include: - Live code - Interactive widgets - Plots - Narrative text - Equations - Images - Video

These documents provide a **complete and self-contained record of a computation** that can be converted to various formats and shared with others using email, [Dropbox](#), version control systems (like [git/GitHub](#)) or [nbviewer.jupyter.org](#).

#### Components

The Jupyter Notebook combines three components:

- **The notebook web application:** An interactive web application for writing and running code interactively and authoring notebook documents.
- **Kernels:** Separate processes started by the notebook web application that runs users' code in a given language and returns output back to the notebook web application. The kernel also handles things like computations for interactive widgets, tab completion and introspection.
- **Notebook documents:** Self-contained documents that contain a representation of all content visible in the notebook web application, including inputs and outputs of the computations, narrative text, equations, images, and rich media representations of objects. Each notebook document has its own kernel.

#### Notebook web application

The notebook web application enables users to:

- **Edit code in the browser**, with automatic syntax highlighting, indentation, and tab completion/introspection.
- **Run code from the browser**, with the results of computations attached to the code which generated them.
- See the results of computations with **rich media representations**, such as HTML, LaTeX, PNG, SVG, PDF, etc.
- Create and use **interactive JavaScript widgets**, which bind interactive user interface controls and visualizations to reactive kernel side computations.
- Author **narrative text** using the [Markdown](#) markup language.
- Include mathematical equations using **LaTeX syntax in Markdown**, which are rendered in-browser by [MathJax](#).

## Kernels

Through Jupyter’s kernel and messaging architecture, the Notebook allows code to be run in a range of different programming languages. For each notebook document that a user opens, the web application starts a kernel that runs the code for that notebook. Each kernel is capable of running code in a single programming language and there are kernels available in the following languages:

- Python(<https://github.com/ipython/ipython>)
- Julia (<https://github.com/JuliaLang/IJulia.jl>)
- R (<https://github.com/IRkernel/IRkernel>)
- Ruby (<https://github.com/minrk/iruby>)
- Haskell (<https://github.com/gibiansky/IHaskell>)
- Scala (<https://github.com/Bridgewater/scala-notebook>)
- node.js (<https://gist.github.com/Carreau/4279371>)
- Go (<https://github.com/takluyver/igo>)

The default kernel runs Python code. The notebook provides a simple way for users to pick which of these kernels is used for a given notebook.

Each of these kernels communicate with the notebook web application and web browser using a JSON over ZeroMQ/WebSockets message protocol that is described [here](#). Most users don’t need to know about these details, but it helps to understand that “kernels run code.”

## Notebook documents

Notebook documents contain the **inputs and outputs** of an interactive session as well as **narrative text** that accompanies the code but is not meant for execution. **Rich output** generated by running code, including HTML, images, video, and plots, is embedded in the notebook, which makes it a complete and self-contained record of a computation.

When you run the notebook web application on your computer, notebook documents are just **files on your local filesystem with a .ipynb extension**. This allows you to use familiar workflows for organizing your notebooks into folders and sharing them with others.

Notebooks consist of a **linear sequence of cells**. There are three basic cell types:

- **Code cells:** Input and output of live code that is run in the kernel
- **Markdown cells:** Narrative text with embedded LaTeX equations
- **Raw cells:** Unformatted text that is included, without modification, when notebooks are converted to different formats using nbconvert

Internally, notebook documents are **JSON data** with **binary values** [base64](#) encoded. This allows them to be **read and manipulated programmatically** by any programming language. Because JSON is a text format, notebook documents are version control friendly.

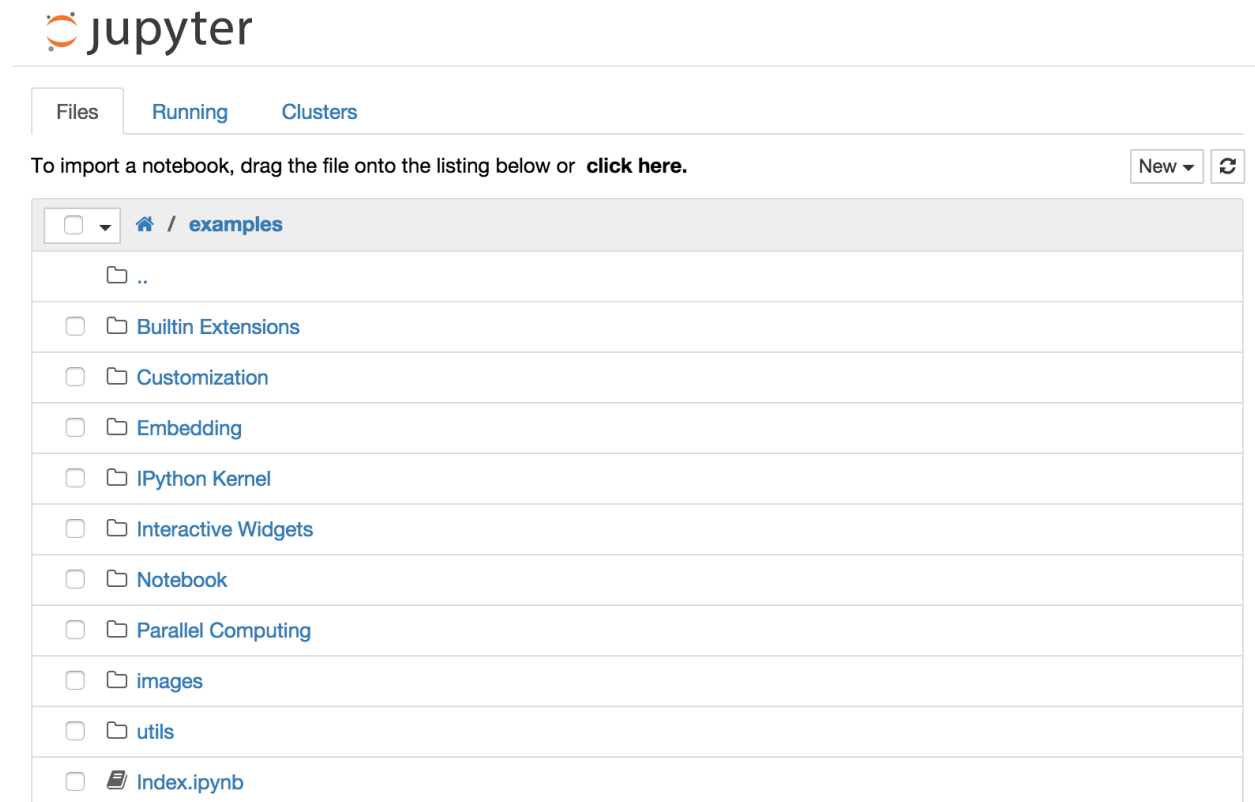

**Notebooks can be exported** to different static formats including HTML, reStructuredText, LaTeX, PDF, and slide shows ([reveal.js](#)) using Jupyter’s nbconvert utility.

Furthermore, any notebook document available from a **public URL or on GitHub can be shared** via [nbviewer](#). This service loads the notebook document from the URL and renders it as a static web page. The resulting web page may thus be shared with others **without their needing to install the Jupyter Notebook**.

## 1.3.2 Notebook Basics

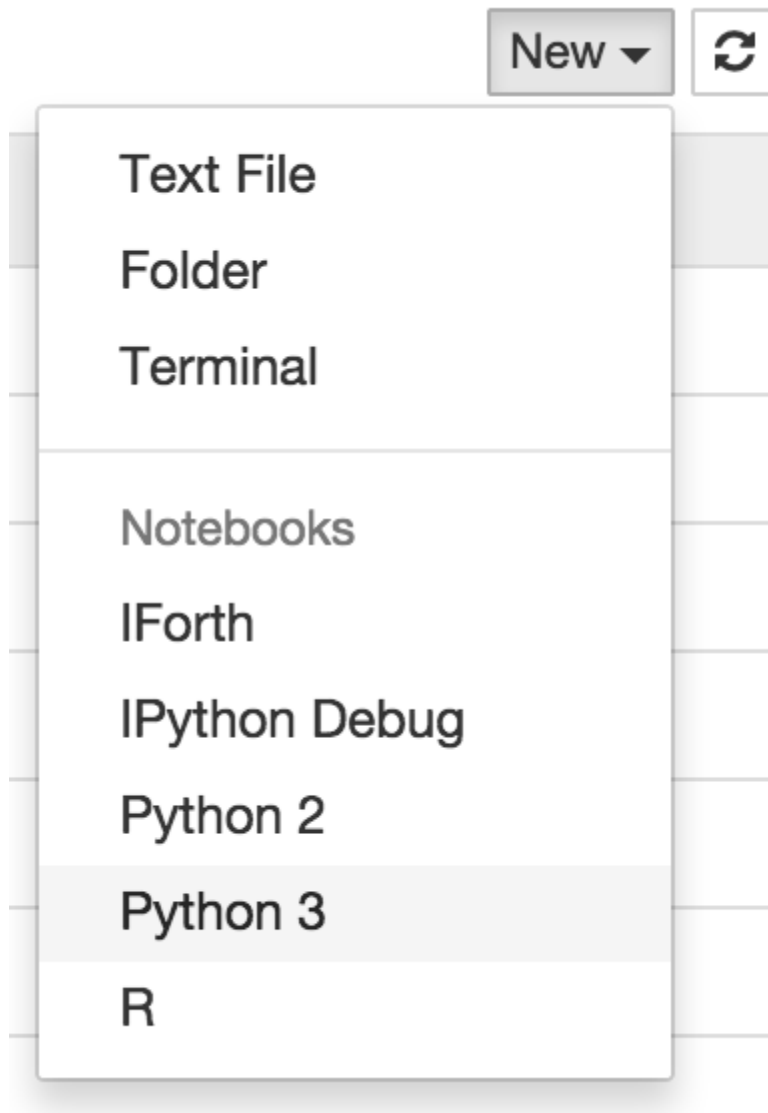

### The Notebook dashboard

When you first start the notebook server, your browser will open to the notebook dashboard. The dashboard serves as a home page for the notebook. Its main purpose is to display the notebooks and files in the current directory. For example, here is a screenshot of the dashboard page for the `examples` directory in the Jupyter repository:

The top of the notebook list displays clickable breadcrumbs of the current directory. By clicking on these breadcrumbs or on sub-directories in the notebook list, you can navigate your file system.

To create a new notebook, click on the “New” button at the top of the list and select a kernel from the dropdown (as seen below). Which kernels are listed depend on what’s installed on the server. Some of the kernels in the screenshot below may not exist as an option to you.

Notebooks and files can be uploaded to the current directory by dragging a notebook file onto the notebook list or by the “click here” text above the list.

The notebook list shows green “Running” text and a green notebook icon next to running notebooks (as seen below). Notebooks remain running until you explicitly shut them down; closing the notebook’s page is not sufficient.

 ▾	 / <a href="#">examples</a>
	..
<input type="checkbox"/> 	<a href="#">Builtin Extensions</a>
<input type="checkbox"/> 	<a href="#">Customization</a>
<input type="checkbox"/> 	<a href="#">Embedding</a>
<input type="checkbox"/> 	<a href="#">IPython Kernel</a>
<input type="checkbox"/> 	<a href="#">Interactive Widgets</a>
<input type="checkbox"/> 	<a href="#">Notebook</a>
<input type="checkbox"/> 	<a href="#">Parallel Computing</a>

<input type="checkbox"/> 	<a href="#">utils</a>
<input checked="" type="checkbox"/> 	<a href="#">Index.ipynb</a> <span style="float: right;">Running</span>

To shutdown, delete, duplicate, or rename a notebook check the checkbox next to it and an array of controls will appear at the top of the notebook list (as seen below). You can also use the same operations on directories and files when applicable.

To see all of your running notebooks along with their directories, click on the “Running” tab:

This view provides a convenient way to track notebooks that you start as you navigate the file system in a long running notebook server.

## Overview of the Notebook UI

If you create a new notebook or open an existing one, you will be taken to the notebook user interface (UI). This UI allows you to run code and author notebook documents interactively. The notebook UI has the following main areas:

- Menu
- Toolbar
- Notebook area and cells

The notebook has an interactive tour of these elements that can be started in the “Help:User Interface Tour” menu item.

## Modal editor

Starting with IPython 2.0, the Jupyter Notebook has a modal user interface. This means that the keyboard does different things depending on which mode the Notebook is in. There are two modes: edit mode and command mode.

## Edit mode

Edit mode is indicated by a green cell border and a prompt showing in the editor area:

```
In [1]: a = 10
```

When a cell is in edit mode, you can type into the cell, like a normal text editor.

Enter edit mode by pressing **Enter** or using the mouse to click on a cell's editor area.

## Command mode

Command mode is indicated by a grey cell border with a blue left margin:

```
In [1]: a = 10
```

When you are in command mode, you are able to edit the notebook as a whole, but not type into individual cells. Most importantly, in command mode, the keyboard is mapped to a set of shortcuts that let you perform notebook and cell actions efficiently. For example, if you are in command mode and you press **c**, you will copy the current cell - no modifier is needed.

Don't try to type into a cell in command mode; unexpected things will happen!

Enter command mode by pressing **Esc** or using the mouse to click *outside* a cell's editor area.

## Mouse navigation

All navigation and actions in the Notebook are available using the mouse through the menubar and toolbar, which are both above the main Notebook area:

The first idea of mouse based navigation is that **cells can be selected by clicking on them**. The currently selected cell gets a grey or green border depending on whether the notebook is in edit or command mode. If you click inside a cell's editor area, you will enter edit mode. If you click on the prompt or output area of a cell you will enter command mode.

If you are running this notebook in a live session (not on <http://nbviewer.jupyter.org>) try selecting different cells and going between edit and command mode. Try typing into a cell.

The second idea of mouse based navigation is that **cell actions usually apply to the currently selected cell**. Thus if you want to run the code in a cell, you would select it and click the

button in the toolbar or the “Cell:Run” menu item. Similarly, to copy a cell you would select it and click the

button in the toolbar or the “Edit:Copy” menu item. With this simple pattern, you should be able to do most everything you need with the mouse.

Markdown cells have one other state that can be modified with the mouse. These cells can either be rendered or unrendered. When they are rendered, you will see a nice formatted representation of the cell's contents. When they are unrendered, you will see the raw text source of the cell. To render the selected cell with the mouse, click the

button in the toolbar or the “Cell:Run” menu item. To unrender the selected cell, double click on the cell.

## Keyboard Navigation

The modal user interface of the Jupyter Notebook has been optimized for efficient keyboard usage. This is made possible by having two different sets of keyboard shortcuts: one set that is active in edit mode and another in command mode.

The most important keyboard shortcuts are **Enter**, which enters edit mode, and **Esc**, which enters command mode.

In edit mode, most of the keyboard is dedicated to typing into the cell's editor. Thus, in edit mode there are relatively few shortcuts. In command mode, the entire keyboard is available for shortcuts, so there are many more. The `Help->Keyboard Shortcuts` dialog lists the available shortcuts.

We recommend learning the command mode shortcuts in the following rough order:

1. Basic navigation: `enter`, `shift-enter`, `up/k`, `down/j`
2. Saving the notebook: `s`
3. Change Cell types: `y`, `m`, `1-6`, `t`
4. Cell creation: `a`, `b`
5. Cell editing: `x`, `c`, `v`, `d`, `z`
6. Kernel operations: `i`, `0` (press twice)

### 1.3.3 Running Code

First and foremost, the Jupyter Notebook is an interactive environment for writing and running code. The notebook is capable of running code in a wide range of languages. However, each notebook is associated with a single kernel. This notebook is associated with the IPython kernel, therefore runs Python code.

#### Code cells allow you to enter and run code

Run a code cell using **Shift-Enter** or pressing the button in the toolbar above:

```
[1]: a = 10
```

```
[2]: print(a)
```

```
10
```

There are two other keyboard shortcuts for running code:

- **Alt-Enter** runs the current cell and inserts a new one below.
- **Ctrl-Enter** run the current cell and enters command mode.

## Managing the Kernel

Code is run in a separate process called the Kernel. The Kernel can be interrupted or restarted. Try running the following cell and then hit the

button in the toolbar above.

```
[3]: import time
     time.sleep(10)
```

If the Kernel dies you will be prompted to restart it. Here we call the low-level system `libc.time` routine with the wrong argument via `ctypes` to segfault the Python interpreter:

```
[5]: import sys
     from ctypes import CDLL
     # This will crash a Linux or Mac system
     # equivalent calls can be made on Windows

     # Uncomment these lines if you would like to see the segfault

     # dll = 'dylib' if sys.platform == 'darwin' else 'so.6'
     # libc = CDLL("libc.%s" % dll)
     # libc.time(-1) # BOOM!!
```

## Cell menu

The “Cell” menu has a number of menu items for running code in different ways. These includes:

- Run and Select Below
- Run and Insert Below
- Run All
- Run All Above
- Run All Below

## Restarting the kernels

The kernel maintains the state of a notebook’s computations. You can reset this state by restarting the kernel. This is done by clicking on the

in the toolbar above.

## `sys.stdout` and `sys.stderr`

The `stdout` and `stderr` streams are displayed as text in the output area.

```
[6]: print("hi, stdout")

hi, stdout
```

```
[7]: from __future__ import print_function
     print('hi, stderr', file=sys.stderr)
```

```
hi, stderr
```

### Output is asynchronous

All output is displayed asynchronously as it is generated in the Kernel. If you execute the next cell, you will see the output one piece at a time, not all at the end.

```
[8]: import time, sys
      for i in range(8):
          print(i)
          time.sleep(0.5)
```

```

```

### Large outputs

To better handle large outputs, the output area can be collapsed. Run the following cell and then single- or double-click on the active area to the left of the output:

```
[9]: for i in range(50):
      print(i)
```

```
0
1
2
3
4

### 1.3.4 Markdown Cells

Text can be added to Jupyter Notebooks using Markdown cells. You can change the cell type to Markdown by using the Cell menu, the toolbar, or the key shortcut `m`. Markdown is a popular markup language that is a superset of HTML. Its specification can be found here:

<https://daringfireball.net/projects/markdown/>

#### Markdown basics

You can make text *italic* or **bold** by surrounding a block of text with a single or double `*` respectively

You can build nested itemized or enumerated lists:

- One
  - Sublist
    - \* This
- Sublist - That - The other thing
- Two
- Sublist
- Three
- Sublist

Now another list:

1. Here we go
  1. Sublist
  2. Sublist
2. There we go
3. Now this

You can add horizontal rules:

---

Here is a blockquote:

Beautiful is better than ugly. Explicit is better than implicit. Simple is better than complex. Complex is better than complicated. Flat is better than nested. Sparse is better than dense. Readability counts. Special cases aren't special enough to break the rules. Although practicality beats purity. Errors should never pass silently. Unless explicitly silenced. In the face of ambiguity, refuse the temptation to guess. There should be one— and preferably only one —obvious way to do it. Although that way may not be obvious at first unless you're Dutch. Now is better than never. Although never is often better than *right* now. If the implementation is hard to explain, it's a bad idea. If the implementation is easy to explain, it may be a good idea. Namespaces are one honking great idea – let's do more of those!

And shorthand for links:

[Jupyter's website](#)

You can use backslash to generate literal characters which would otherwise have special meaning in the Markdown syntax.

```
\*literal asterisks\*
*literal asterisks*
```

Use double backslash to generate the literal \$ symbol.

## Headings

You can add headings by starting a line with one (or multiple) # followed by a space, as in the following example:

```
# Heading 1
# Heading 2
## Heading 2.1
## Heading 2.2
```

## Embedded code

You can embed code meant for illustration instead of execution in Python:

```
def f(x):
    """a docstring"""
    return x**2
```

or other languages:

```
for (i=0; i<n; i++) {
    printf("hello %d\n", i);
    x += 4;
}
```

## LaTeX equations

Courtesy of MathJax, you can include mathematical expressions both inline:  $e^{i\pi} + 1 = 0$  and displayed:

$$e^x = \sum_{i=0}^{\infty} \frac{1}{i!} x^i \quad (1.1)$$

Inline expressions can be added by surrounding the latex code with \$:

```
$e^{i\pi} + 1 = 0$
```

Expressions on their own line are surrounded by `\begin{equation}` and `\end{equation}`:

```
\begin{equation}
e^x = \sum_{i=0}^{\infty} \frac{1}{i!} x^i
\end{equation}
```

## GitHub flavored markdown

The Notebook webapp supports Github flavored markdown meaning that you can use triple backticks for code blocks:

```
```python
print "Hello World"
```

```javascript
console.log("Hello World")
```
```

Gives:

```
print "Hello World"
```

```
console.log("Hello World")
```

And a table like this:

```
This	is
a	table
```

A nice HTML Table:

|      |       |
|------|-------|
| This | is    |
| a    | table |

## General HTML

Because Markdown is a superset of HTML you can even add things like HTML tables:

Header 1

Header 2

row 1, cell 1

row 1, cell 2

row 2, cell 1

row 2, cell 2

## Local files

If you have local files in your Notebook directory, you can refer to these files in Markdown cells directly:

```
[subdirectory/]<filename>
```

For example, in the images folder, we have the Python logo:

```

```

and a video with the HTML5 video tag:

```
<video controls src="../../../images/animation.m4v">animation</video>
```

animation

These do not embed the data into the notebook file, and require that the files exist when you are viewing the notebook.

## Security of local files

Note that this means that the Jupyter notebook server also acts as a generic file server for files inside the same tree as your notebooks. Access is not granted outside the notebook folder so you have strict control over what files are visible, but for this reason it is highly recommended that you do not run the notebook server with a notebook directory at a high level in your filesystem (e.g. your home directory).

When you run the notebook in a password-protected manner, local file access is restricted to authenticated users unless read-only views are active.

## Markdown attachments

Since Jupyter notebook version 5.0, in addition to referencing external file you can attach a file to a markdown cell. To do so drag the file from in a markdown cell while editing it:

Files are stored in cell metadata and will be automatically scrubbed at save-time if not referenced. You can recognize attached images from other files by their url that starts with `attachment:`. For the image above:

```
![pycon-logo.jpg](attachment:pycon-logo.jpg)
```

Keep in mind that attached files will increase the size of your notebook.

You can manually edit the attachment by using the `View > Cell Toolbar > Attachment` menu, but you should not need to.

### 1.3.5 Keyboard Shortcut Customization

You can customize the `command` mode shortcuts from within the Notebook Application itself.

Head to the **Settings** menu and select the **Settings Editor** item. A dialog will guide you through the process of adding custom keyboard shortcuts.

Keyboard shortcut set from within the Notebook Application will be persisted to your configuration file. A single action may have several shortcuts attached to it.

### 1.3.6 Importing Jupyter Notebooks as Modules

It is a common problem that people want to import code from Jupyter Notebooks. This is made difficult by the fact that Notebooks are not plain Python files, and thus cannot be imported by the regular Python machinery.

Fortunately, Python provides some fairly sophisticated [hooks](#) into the import machinery, so we can actually make Jupyter notebooks importable without much difficulty, and only using public APIs.

```
[ ]: import io, os, sys, types
```

```
[ ]: from IPython import get_ipython
     from nbformat import read
     from IPython.core.interactiveshell import InteractiveShell
```

Import hooks typically take the form of two objects:

1. a Module **Loader**, which takes a module name (e.g. 'IPython.display'), and returns a Module
2. a Module **Finder**, which figures out whether a module might exist, and tells Python what **Loader** to use

```
[ ]: def find_notebook(fullname, path=None):
    """find a notebook, given its fully qualified name and an optional path

    This turns "foo.bar" into "foo/bar.ipynb"
    and tries turning "Foo_Bar" into "Foo Bar" if Foo_Bar
    does not exist.
    """
    name = fullname.rsplit('.', 1)[-1]
    if not path:
        path = ['']
    for d in path:
        nb_path = os.path.join(d, name + ".ipynb")
        if os.path.isfile(nb_path):
            return nb_path
        # let import Notebook_Name find "Notebook Name.ipynb"
        nb_path = nb_path.replace("-", " ")
        if os.path.isfile(nb_path):
            return nb_path
```

#### Notebook Loader

Here we have our Notebook Loader. It's actually quite simple - once we figure out the filename of the module, all it does is:

1. load the notebook document into memory
2. create an empty Module
3. execute every cell in the Module namespace

Since IPython cells can have extended syntax, the IPython transform is applied to turn each of these cells into their pure-Python counterparts before executing them. If all of your notebook cells are pure-Python, this step is unnecessary.

```
[ ]: class NotebookLoader(object):
    """Module Loader for Jupyter Notebooks"""
    def __init__(self, path=None):
```

(continues on next page)

(continued from previous page)

```
self.shell = InteractiveShell.instance()
self.path = path

def load_module(self, fullname):
    """import a notebook as a module"""
    path = find_notebook(fullname, self.path)

    print ("importing Jupyter notebook from %s" % path)

    # load the notebook object
    with io.open(path, 'r', encoding='utf-8') as f:
        nb = read(f, 4)

    # create the module and add it to sys.modules
    # if name in sys.modules:
    #     return sys.modules[name]
    mod = types.ModuleType(fullname)
    mod.__file__ = path
    mod.__loader__ = self
    mod.__dict__['get_ipython'] = get_ipython
    sys.modules[fullname] = mod

    # extra work to ensure that magics that would affect the user_ns
    # actually affect the notebook module's ns
    save_user_ns = self.shell.user_ns
    self.shell.user_ns = mod.__dict__

    try:
        for cell in nb.cells:
            if cell.cell_type == 'code':
                # transform the input to executable Python
                code = self.shell.input_transformer_manager.transform_cell(cell.source)
                # run the code in the module
                exec(code, mod.__dict__)
    finally:
        self.shell.user_ns = save_user_ns
    return mod
```

## The Module Finder

The finder is a simple object that tells you whether a name can be imported, and returns the appropriate loader. All this one does is check, when you do:

```
import mynotebook
```

it checks whether `mynotebook.ipynb` exists. If a notebook is found, then it returns a `NotebookLoader`.

Any extra logic is just for resolving paths within packages.

```
[ ]: class NotebookFinder(object):
    """Module finder that locates Jupyter Notebooks"""
    def __init__(self):
        self.loaders = {}

    def find_module(self, fullname, path=None):
        nb_path = find_notebook(fullname, path)
        if not nb_path:
            return

        key = path
        if path:
            # lists aren't hashable
            key = os.path.sep.join(path)

        if key not in self.loaders:
            self.loaders[key] = NotebookLoader(path)
        return self.loaders[key]
```

### Register the hook

Now we register the NotebookFinder with `sys.meta_path`

```
[ ]: sys.meta_path.append(NotebookFinder())
```

After this point, my notebooks should be importable.

Let's look at what we have in the CWD:

```
[ ]: ls nbpackage
```

So I should be able to import `nbpackage.mynotebook`.

```
[ ]: import nbpackage.mynotebook
```

### Aside: displaying notebooks

Here is some simple code to display the contents of a notebook with syntax highlighting, etc.

```
[ ]: from pygments import highlight
    from pygments.lexers import PythonLexer
    from pygments.formatters import HtmlFormatter

    from IPython.display import display, HTML

    formatter = HtmlFormatter()
    lexer = PythonLexer()

    # publish the CSS for pygments highlighting
    display(HTML("""
```

(continues on next page)

(continued from previous page)

```
<style type='text/css'>
%s
</style>
""" % formatter.get_style_defs()
))
```

```
[ ]: def show_notebook(fname):
    """display a short summary of the cells of a notebook"""
    with io.open(fname, 'r', encoding='utf-8') as f:
        nb = read(f, 4)
        html = []
        for cell in nb.cells:
            html.append("<h4>%s cell</h4>" % cell.cell_type)
            if cell.cell_type == 'code':
                html.append(highlight(cell.source, lexer, formatter))
            else:
                html.append("<pre>%s</pre>" % cell.source)
        display(HTML('\n'.join(html)))

show_notebook(os.path.join("nbpackage", "mynotebook.ipynb"))
```

So my notebook has some code cells, one of which contains some IPython syntax.

Let's see what happens when we import it

```
[ ]: from nbpackage import mynotebook
```

Hooray, it imported! Does it work?

```
[ ]: mynotebook.foo()
```

Hooray again!

Even the function that contains IPython syntax works:

```
[ ]: mynotebook.has_ip_syntax()
```

## Notebooks in packages

We also have a notebook inside the nb package, so let's make sure that works as well.

```
[ ]: ls nbpackage/nbs
```

Note that the `__init__.py` is necessary for nb to be considered a package, just like usual.

```
[ ]: show_notebook(os.path.join("nbpackage", "nbs", "other.ipynb"))
```

```
[ ]: from nbpackage.nbs import other
other.bar(5)
```

So now we have importable notebooks, from both the local directory and inside packages.

I can even put a notebook inside IPython, to further demonstrate that this is working properly:

```
[ ]: import shutil
    from IPython.paths import get_ipython_package_dir

    utils = os.path.join(get_ipython_package_dir(), 'utils')
    shutil.copy(os.path.join("nbpackage", "mynotebook.ipynb"),
                os.path.join(utils, "inside_ipython.ipynb")
    )
```

and import the notebook from IPython.utils

```
[ ]: from IPython.utils import inside_ipython
    inside_ipython.whatsmyname()
```

This approach can even import functions and classes that are defined in a notebook using the %%cython magic.

### 1.3.7 Connecting to an existing IPython kernel using the Qt Console

#### The Frontend/Kernel Model

The traditional IPython (ipython) consists of a single process that combines a terminal based UI with the process that runs the users code.

While this traditional application still exists, the modern Jupyter consists of two processes:

- Kernel: this is the process that runs the users code.
- Frontend: this is the process that provides the user interface where the user types code and sees results.

Jupyter currently has 3 frontends:

- Terminal Console (jupyter console)
- Qt Console (jupyter qtconsole)
- Notebook (jupyter notebook)

The Kernel and Frontend communicate over a ZeroMQ/JSON based messaging protocol, which allows multiple Frontends (even of different types) to communicate with a single Kernel. This opens the door for all sorts of interesting things, such as connecting a Console or Qt Console to a Notebook's Kernel. For example, you may want to connect a Qt console to your Notebook's Kernel and use it as a help browser, calling ?? on objects in the Qt console (whose pager is more flexible than the one in the notebook).

This Notebook describes how you would connect another Frontend to an IPython Kernel that is associated with a Notebook. The commands currently given here are specific to the IPython kernel.

#### Manual connection

To connect another Frontend to a Kernel manually, you first need to find out the connection information for the Kernel using the %connect\_info magic:

```
[ ]: %connect_info
```

You can see that this magic displays everything you need to connect to this Notebook's Kernel.

### Automatic connection using a new Qt Console

You can also start a new Qt Console connected to your current Kernel by using the `%qtconsole` magic. This will detect the necessary connection information and start the Qt Console for you automatically.

```
[ ]: a = 10
```

```
[ ]: %qtconsole
```

The Markdown parser included in the Jupyter Notebook is MathJax-aware. This means that you can freely mix in mathematical expressions using the [MathJax subset of Tex and LaTeX](#). Some examples from the [MathJax demos site](#) are reproduced below, as well as the Markdown+TeX source.

### 1.3.8 Motivating Examples

#### The Lorenz Equations

##### Source

```
\begin{align}
\dot{x} &= \sigma(y-x) \\
\dot{y} &= \rho x - y - xz \\
\dot{z} &= -\beta z + xy
\end{align}
```

##### Display

#### The Cauchy-Schwarz Inequality

##### Source

```
\begin{equation*}
\left( \sum_{k=1}^n a_k b_k \right)^2 \leq \left( \sum_{k=1}^n a_k^2 \right) \left( \sum_{k=1}^n b_k^2 \right)
\end{equation*}
```

##### Display

$$\left( \sum_{k=1}^n a_k b_k \right)^2 \leq \left( \sum_{k=1}^n a_k^2 \right) \left( \sum_{k=1}^n b_k^2 \right)$$

## A Cross Product Formula

### Source

```
\begin{equation*}
\mathbf{V}_1 \times \mathbf{V}_2 = \begin{vmatrix}
\mathbf{i} & \mathbf{j} & \mathbf{k} \\
\frac{\partial X}{\partial u} & \frac{\partial Y}{\partial u} & 0 \\
\frac{\partial X}{\partial v} & \frac{\partial Y}{\partial v} & 0
\end{vmatrix}
\end{equation*}
```

### Display

$$\mathbf{V}_1 \times \mathbf{V}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial X}{\partial u} & \frac{\partial Y}{\partial u} & 0 \\ \frac{\partial X}{\partial v} & \frac{\partial Y}{\partial v} & 0 \end{vmatrix}$$

The probability of getting (k) heads when flipping (n) coins is

### Source

```
\begin{equation*}
P(E) = \{n \text{ choose } k\} p^k (1-p)^{n-k}
\end{equation*}
```

### Display

$$P(E) = \binom{n}{k} p^k (1-p)^{n-k}$$

## An Identity of Ramanujan

### Source

```
\begin{equation*}
\frac{1}{1+\frac{1}{\sqrt{5}}-\sqrt{5}} e^{\frac{25}{\pi}} =
1+\frac{e^{-2\pi}}{1+\frac{e^{-4\pi}}{1+\frac{e^{-6\pi}}{1+\frac{e^{-8\pi}}{1+\dots}}}}
\end{equation*}
```

## Display

$$\frac{1}{\left(\sqrt{\phi\sqrt{5}-\phi}\right)e^{\frac{2}{3}\pi}} = 1 + \frac{e^{-2\pi}}{1 + \frac{e^{-4\pi}}{1 + \frac{e^{-6\pi}}{1 + \frac{e^{-8\pi}}{1 + \dots}}}}$$

## A Rogers-Ramanujan Identity

### Source

```
\begin{equation*}
1 + \frac{q^2}{(1-q)} + \frac{q^6}{(1-q)(1-q^2)} + \cdots =
\prod_{j=0}^{\infty} \frac{1}{(1-q^{5j+2})(1-q^{5j+3})},
\quad \text{for } |q| < 1.
\end{equation*}
```

## Display

$$1 + \frac{q^2}{(1-q)} + \frac{q^6}{(1-q)(1-q^2)} + \cdots = \prod_{j=0}^{\infty} \frac{1}{(1-q^{5j+2})(1-q^{5j+3})}, \quad \text{for } |q| < 1.$$

## Maxwell's Equations

### Source

```
\begin{align}
\nabla \times \vec{\mathbf{B}} &= \frac{1}{c} \frac{\partial \vec{\mathbf{E}}}{\partial t} \\
\nabla \cdot \vec{\mathbf{E}} &= \frac{4\pi}{c} \rho \\
\nabla \times \vec{\mathbf{E}} &= -\frac{1}{c} \frac{\partial \vec{\mathbf{B}}}{\partial t} \\
\nabla \cdot \vec{\mathbf{B}} &= 0
\end{align}
```

## Display

## Equation Numbering and References

Equation numbering and referencing will be available in a future version of the Jupyter notebook.

## Inline Typesetting (Mixing Markdown and TeX)

While display equations look good for a page of samples, the ability to mix math and *formatted text* in a paragraph is also important.

### Source

This expression  $\sqrt{3x-1}+(1+x)^2$  is an example of a TeX inline equation in a [\[Markdown-formatted\]](https://daringfireball.net/projects/markdown/) (https://daringfireball.net/projects/markdown/) sentence.

### Display

This expression  $\sqrt{3x-1}+(1+x)^2$  is an example of a TeX inline equation in a [Markdown-formatted](#) sentence.

## Other Syntax

You will notice in other places on the web that  $\$$  are needed explicitly to begin and end MathJax typesetting. This is **not** required if you will be using TeX environments, but the Jupyter notebook will accept this syntax on legacy notebooks.

### Source

```
$$
\begin{array}{c}
y_1 \\\
y_2 \mathtt{t}_i \\\
z_{3,4}
\end{array}
$$
```

```
$$
\begin{array}{c}
y_1 \cr
y_2 \mathtt{t}_i \cr
y_{3}
\end{array}
$$
```

```
$$\begin{eqnarray}
x' &=& \& x \sin\phi \&+& z \cos\phi \\\
z' &=& - \& x \cos\phi \&+& z \sin\phi \\\
\end{eqnarray}$$
```

```
$$
x=4
$$
```

Display

$$\begin{aligned} & y_1 \\ & y_2 \mathfrak{t}_i \\ & z_{3,4} \end{aligned}$$

$$\begin{aligned} & y_1 \\ & y_2 \mathfrak{t}_i \\ & y_3 \end{aligned}$$

$$to$$

$$\begin{aligned} x' &= \\ & x \sin \phi \\ & + z \cos \phi \\ z' &= \\ & -x \cos \phi \\ & + z \sin \phi \end{aligned}$$

$$(1.2)$$

$$\begin{aligned} &= \\ &+ \\ - &= \\ &+x \cos \phi \\ &z \sin \phi \end{aligned}$$

$$x = 4$$

## 1.4 What to do when things go wrong

First, have a look at the common problems listed below. If you can figure it out from these notes, it will be quicker than asking for help.

Check that you have the latest version of any packages that look relevant. Unfortunately it's not always easy to figure out what packages are relevant, but if there was a bug that's already been fixed, it's easy to upgrade and get on with what you wanted to do.

### 1.4.1 Jupyter fails to start

- Have you `installed it`? ;-)
- If you're using a menu shortcut or Anaconda launcher to start it, try opening a terminal or command prompt and running the command `jupyter notebook`.
- If it can't find `jupyter`, you may need to configure your `PATH` environment variable. If you don't know what that means, and don't want to find out, just (re)install Anaconda with the default settings, and it should set up `PATH` correctly.
- If Jupyter gives an error that it can't find `notebook`, check with `pip` or `conda` that the `notebook` package is installed.
- Try running `jupyter-notebook` (with a hyphen). This should normally be the same as `jupyter notebook` (with a space), but if there's any difference, the version with the hyphen is the 'real' launcher, and the other one wraps that.

### 1.4.2 Jupyter doesn't load or doesn't work in the browser

- Try in another browser (e.g. if you normally use Firefox, try with Chrome). This helps pin down where the problem is.
- Try disabling any browser extensions and/or any Jupyter extensions you have installed.
- Some internet security software can interfere with Jupyter. If you have security software, try turning it off temporarily, and look in the settings for a more long-term solution.
- In the address bar, try changing between `localhost` and `127.0.0.1`. They should be the same, but in some cases it makes a difference.

### 1.4.3 Jupyter can't start a kernel

Files called *kernel specs* tell Jupyter how to start different kinds of kernels. To see where these are on your system, run `jupyter kernelspec list`:

```
$ jupyter kernelspec list
Available kernels:
python3      /home/takluyver/.local/lib/python3.6/site-packages/ipykernel/resources
bash         /home/takluyver/.local/share/jupyter/kernels/bash
ir           /home/takluyver/.local/share/jupyter/kernels/ir
```

There's a special fallback for the Python kernel: if it doesn't find a real kernelspec, but it can import the `ipykernel` package, it provides a kernel which will run in the same Python environment as the notebook server. A path ending in `ipykernel/resources`, like in the example above, is this default kernel. The default often does what you want,

so if the `python3` kernelspec points somewhere else and you can't start a Python kernel, try deleting or renaming that kernelspec folder to expose the default.

If your problem is with another kernel, not the Python one we maintain, you may need to look for support about that kernel.

### 1.4.4 Python Environments

Multiple python environments, whether based on Anaconda or Python Virtual environments, are often the source of reported issues. In many cases, these issues stem from the Notebook server running in one environment, while the kernel and/or its resources, derive from another environment. Indicators of this scenario include:

- `import` statements within code cells producing `ImportError` or `ModuleNotFound` exceptions.
- General kernel startup failures exhibited by nothing happening when attempting to execute a cell.

In these situations, take a close look at your environment structure and ensure all packages required by your notebook's code are installed in the correct environment. If you need to run the kernel from different environments than your Notebook server, check out [IPython's documentation](#) for using kernels from different environments as this is the recommended approach. Anaconda's `nb_conda_kernels` package might also be an option for you in these scenarios.

Another thing to check is the `kernel.json` file that will be located in the aforementioned *kernel specs* directory identified by running `jupyter kernelspec list`. This file will contain an `argv` stanza that includes the actual command to run when launching the kernel. Oftentimes, when reinstalling python environments, a previous `kernel.json` will reference an python executable from an old or non-existent location. As a result, it's always a good idea when encountering kernel startup issues to validate the `argv` stanza to ensure all file references exist and are appropriate.

### 1.4.5 Windows Systems

Although Jupyter Notebook is primarily developed on the various flavors of the Unix operating system it also supports Microsoft Windows - which introduces its own set of commonly encountered issues, particularly in the areas of security, process management and lower-level libraries.

#### pywin32 Issues

The primary package for interacting with Windows' primitives is `pywin32`.

- Issues surrounding the creation of the kernel's communication file utilize `jupyter_core`'s `secure_write()` function. This function ensures a file is created in which only the owner of the file has access. If libraries like `pywin32` are not properly installed, issues can arise when it's necessary to use the native Windows libraries.

Here's a portion of such a traceback:

```
File "c:\users\jovyan\python\myenv.venv\lib\site-packages\jupyter_core\paths.py", line 424, in secure_write
win32_restrict_file_to_user(fname)
File "c:\users\jovyan\python\myenv.venv\lib\site-packages\jupyter_core\paths.py", line 359, in win32_restrict_file_to_user
import win32api
ImportError: DLL load failed: The specified module could not be found.
```

- As noted earlier, the installation of `pywin32` can be problematic on Windows configurations. When such an issue occurs, you may need to revisit how the environment was setup. Pay careful attention to whether you're running the 32 or 64 bit versions of Windows and be sure to install appropriate packages for that environment.

Here's a portion of such a traceback:

```
File "C:\Users\jovyan\AppData\Roaming\Python\Python37\site-packages\jupyter_core\
↳paths.py", line 435, in secure_write
win32_restrict_file_to_user(fname)
File "C:\Users\jovyan\AppData\Roaming\Python\Python37\site-packages\jupyter_core\
↳paths.py", line 361, in win32_restrict_file_to_user
import win32api
ImportError: DLL load failed: %1 is not a valid Win32 application
```

## Resolving pywin32 Issues

In this case, your pywin32 module may not be installed correctly and the following should be attempted:

```
pip install --upgrade pywin32
```

or:

```
conda install --force-reinstall pywin32
```

followed by:

```
python.exe Scripts/pywin32_postinstall.py -install
```

where Scripts is located in the active Python's installation location.

- Another common failure specific to Windows environments is the location of various python commands. On \*nix systems, these typically reside in the bin directory of the active Python environment. However, on Windows, these tend to reside in the Scripts folder - which is a sibling to bin. As a result, when encountering kernel startup issues, again, check the argv stanza and verify it's pointing to a valid file. You may find that it's pointing in bin when Scripts is correct, or the referenced file does not include its .exe extension - typically resulting in FileNotFoundError exceptions.

## 1.4.6 This Worked An Hour Ago

The Jupyter stack is very complex and rightfully so, there's a lot going on. On occasion you might find the system working perfectly well, then, suddenly, you can't get past a certain cell due to import failures. In these situations, it's best to ask yourself if any new python files were added to your notebook development area.

These issues are usually evident by carefully analyzing the traceback produced in the notebook error or the Notebook server's command window. In these cases, you'll typically find the Python kernel code (from IPython and ipykernel) performing *its* imports and notice a file from your Notebook development error included in that traceback followed by an AttributeError:

```
File "C:\Users\jovyan\anaconda3\lib\site-packages\ipykernel\connect.py", line 13, in
from IPython.core.profiledir import ProfileDir
File "C:\Users\jovyan\anaconda3\lib\site-packages\IPython_init.py", line 55, in
from .core.application import Application
...
File "C:\Users\jovyan\anaconda3\lib\site-packages\ipython_genutils\path.py", line 13, in
import random
File "C:\Users\jovyan\Desktop\Notebooks\random.py", line 4, in
rand_set = random.sample(english_words_lower_set, 12)
AttributeError: module 'random' has no attribute 'sample'
```

What has happened is that you have named a file that conflicts with an installed package that is used by the kernel software and now introduces a conflict preventing the kernel's startup.

**Resolution:** You'll need to rename your file. A best practice would be to prefix or *namespace* your files so as not to conflict with any python package.

### 1.4.7 Asking for help

As with any problem, try searching to see if someone has already found an answer. If you can't find an existing answer, you can ask questions at:

- The [Jupyter Discourse Forum](#)
- The [jupyter-notebook](#) tag on [Stackoverflow](#)
- Peruse the [jupyter/help](#) repository on [Github](#) (read-only)
- Or in an issue on another repository, if it's clear which component is responsible. Typical repositories include:
  - [jupyter\\_core](#) - `secure_write()` and file path issues
  - [jupyter\\_client](#) - kernel management issues found in Notebook server's command window.
  - [IPython](#) and [ipykernel](#) - kernel runtime issues typically found in Notebook server's command window and/or Notebook cell execution.

### Gathering Information

Should you find that your problem warrants that an issue be opened in [notebook](#) please don't forget to provide details like the following:

- What error messages do you see (within your notebook and, more importantly, in the Notebook server's command window)?
- What platform are you on?
- How did you install Jupyter?
- What have you tried already?

The `jupyter troubleshoot` command collects a lot of information about your installation, which can also be useful.

When providing textual information, it's most helpful if you can *scrape* the contents into the issue rather than providing a screenshot. This enables others to select pieces of that content so they can search more efficiently and try to help.

Remember that it's not anyone's job to help you. We want Jupyter to work for you, but we can't always help everyone individually.

## 1.5 Changelog

A summary of changes in the Jupyter notebook. For more detailed information, see [GitHub](#).

Use `pip install notebook --upgrade` or `conda upgrade notebook` to upgrade to the latest release.

We strongly recommend that you upgrade pip to version 9+ of pip before upgrading notebook.

Use `pip install pip --upgrade` to upgrade pip. Check pip version with `pip --version`.

### 1.5.1 7.0.0a2

(Full Changelog)

#### Enhancements made

- Add support for opening a document with a different factory #6315 (@jtpio)
- Minor copy edit in README #6313 (@jweill-aws)

#### Bugs fixed

- Fix rendering of markdown #6318 (@jtpio)

#### Maintenance and upkeep improvements

- Update to JupyterLab 4.0.0a22 #6314 (@jtpio)

#### Documentation improvements

- docs: fix spelling #6317 (@dijonkitchen)
- Minor copy edit in README #6313 (@jweill-aws)
- Update example notebook on Binder #6306 (@jtpio)

#### Contributors to this release

(GitHub contributors page for this release)

@dijonkitchen | @fcollonval | @github-actions | @jtpio | @jweill-aws

### 1.5.2 7.0.0a1

(Full Changelog)

#### Enhancements made

- Notebook v7 scaffolding #6294 (@jtpio)

#### Maintenance and upkeep improvements

- Clean up CI #6304 (@blink1073)
- Remove the custom run keyboard shortcut #6303 (@jtpio)
- Bump nanoid from 3.1.30 to 3.3.1 in /ui-tests #6302 (@dependabot)
- Bump simple-get from 3.1.0 to 3.1.1 in /ui-tests #6301 (@dependabot)
- Bump url-parse from 1.5.4 to 1.5.10 in /ui-tests #6300 (@dependabot)
- Bump node-fetch from 2.6.6 to 2.6.7 in /ui-tests #6299 (@dependabot)

- Bump follow-redirects from 1.14.5 to 1.14.9 in /ui-tests #6298 (@dependabot)

### Contributors to this release

@blink1073 | @dependabot | @github-actions | @jtpio | @kevin-bates | @Zsailer

### 1.5.3 6.4.8

(Full Changelog)

### Bugs fixed

- Fix to remove potential memory leak on Jupyter Notebooks ZMQChannelHandler code #6251 (@Vishwajeet0510)

### Contributors to this release

(GitHub contributors page for this release)

@Vishwajeet0510

### 1.5.4 6.4.7

(Full Changelog)

### Bugs fixed

- Fix Chinese punctuation #6268 (@LiHua-Official)
- Add date field to kernel message header #6265 (@kevin-bates)
- Fix deprecation warning #6253 (@tornaria)

### Maintenance and upkeep improvements

- Enforce labels on PRs #6235 (@blink1073)
- Fix: CI error for python 3.6 & macOS #6215 (@penguinolog)

## Other merged PRs

- handle KeyError when get session #6245 (@ccw630)
- Updated doc for passwd #6209 (@antoinecarme)

## Contributors to this release

(GitHub contributors page for this release)

@antoinecarme | @blink1073 | @ccw630 | @kevin-bates | @LiHua-Official | @penguinolog | @tornaria

## 1.5.5 6.4.6

(Full Changelog)

## Bugs fixed

- Fix asyncio error when opening notebooks #6221 (@dleen)
- Change to use a universal Chinese translation on certain words #6218 (@jackexu)
- Fix Chinese translation typo #6211 (@maliubiao)
- Fix send2trash tests failing on Windows #6127 (@dolphinus)

## Maintenance and upkeep improvements

- TST: don't look in user site for serverextensions #6233 (@bnavigator)
- Enable terminal tests as pywinpty is ported for python 3.9 #6228 (@nsait-linaro)

## Contributors to this release

(GitHub contributors page for this release)

@bnavigator | @dleen | @dolphinus | @jackexu | @kevin-bates | @maliubiao | @nsait-linaro | @takluyver | @Zsailer

## 1.5.6 6.4.5

(Full Changelog)

## Bug fixes

- Recover from failure to render mimetype #6181 (@martinRenou)

## Maintenance and upkeep improvements

- Fix crypto handling #6197 (@blink1073)
- Fix jupyter\_client warning #6178 (@martinRenou)

## Documentation improvements

- Fix nbsphinx settings #6200 (@mgeier)
- Fully revert the pinning of nbsphinx to 0.8.6 #6201 (@kevin-bates)
- Pin nbsphinx to 0.8.6, clean up orphaned resources #6194 (@kevin-bates)
- Fix typo in docstring #6188 (@jgarte)

## Contributors to this release

(GitHub contributors page for this release)

@blink1073 | @jgarte | @kevin-bates | @martinRenou | @mgeier

## 1.5.7 6.4.4

(Full Changelog)

## Documentation improvements

- Update Manual Release Instructions #6152 (@blink1073)

## Other merged PRs

- Use default JupyterLab CSS sanitizer options for Markdown #6160 (@krassowski)
- Fix syntax highlight #6128 (@massongit)

## Contributors to this release

(GitHub contributors page for this release)

@blink1073 | @kevin-bates | @krassowski | @massongit | @minrk | @Zsailer

## 1.5.8 6.4.3

(Full Changelog)

### Bugs fixed

- Add @babel/core dependency #6133 (@afshin)
- Switch webpack to production mode #6131 (@afshin)

### Maintenance and upkeep improvements

- Clean up link checking #6130 (@blink1073)

### Contributors to this release

(GitHub contributors page for this release)

@afshin | @blink1073 | @Zsailer

## 1.5.9 6.4.2

(Full Changelog)

### Bugs fixed

- Add missing file to manifest #6122 (@afshin)
- Fix issue #3218 #6108 (@Nazeeh21)
- Fix version of jupyter-packaging in pyproject.toml #6101 (@frenzymadness)
- “#element”.tooltip is not a function on home page fixed. #6070 @ilayh123

### Maintenance and upkeep improvements

- Enhancements to the desktop entry #6099 (@Amr-Ibra)
- Add missing spaces to help messages in config file #6085 (@saiwing-yeung)

### Contributors to this release

(GitHub contributors page for this release)

@afshin | @Amr-Ibra | @frenzymadness | @ilayh123 | @kevin-bates | @Nazeeh21 | @saiwing-yeung

## 1.5.10 6.4.0

(Full Changelog)

### Bugs fixed

- Fix Handling of Encoded Paths in Save As Dialog #6030 (@afshin)
- Fix: split\_cell doesn't always split cell #6017 (@gamestrUS)
- Correct 'Content-Type' headers #6026 (@faucet)
- Fix skipped tests & remove deprecation warnings #6018 (@befeleme)
- [Gateway] Track only this server's kernels #5980 (@kevin-bates)
- Bind the HTTPServer in start #6061

### Maintenance and upkeep improvements

- Revert "do not apply asyncio patch for tornado >=6.1" #6052 (@minrk)
- Use Jupyter Releaser #6048 (@afshin)
- Add Workflow Permissions for Lock Bot #6042 (@jtpio)
- Fixes related to the recent changes in the documentation #6021 (@frenzymadness)
- Add maths checks in CSS reference test #6035 (@stef4k)
- Add Issue Lock and Answered Bots #6019 (@afshin)

### Documentation improvements

- Spelling correction #6045 (@wggillen)
- Minor typographical and comment changes #6025 (@misterhay)
- Fixes related to the recent changes in the documentation #6021 (@frenzymadness)
- Fix readthedocs environment #6020 (@blink1073)

### Contributors to this release

(GitHub contributors page for this release)

@afshin | @befeleme | @blink1073 | @faucet | @frenzymadness | @gamestrUS | @jtpio | @kevin-bates | @minrk | @misterhay | @stef4k | @wggillen

## 1.5.11 6.3.0

### Merged PRs

- Add square logo and desktop entry files #6010 (@befeleme)
- Modernize Changelog #6008 (@afshin)
- Add missing "import inspect" #5999 (@mgeier)
- Add Codecov badge to README #5989 (@thomasrockhu)
- Remove configuration for nosetests from setup.cfg #5986 (@frenzymadness)
- Update security.rst #5978 (@dlrice)

- Docs-Translations: Updated Hindi and Chinese Readme.md #5976 (@rjn01)
- Allow /metrics by default if auth is off #5974 (@blairdrummond)
- Skip terminal tests on Windows 3.9+ (temporary) #5968 (@kevin-bates)
- Update GatewayKernelManager to derive from AsyncMappingKernelManager #5966 (@kevin-bates)
- Drop use of deprecated pyzmq.ioloop #5965 (@kevin-bates)
- Drop support for Python 3.5 #5962 (@kevin-bates)
- Allow jupyter\_server-based contents managers in notebook #5957 (@afshin)
- Russian translation fixes #5954 (@insolor)
- Increase culling test idle timeout #5952 (@kevin-bates)
- Re-enable support for answer\_yes flag #5941 (@afshin)
- Replace Travis and Appveyor with Github Actions #5938 (@kevin-bates)
- DOC: Server extension, extra docs on configuration/authentication. #5937 (@Carreau)

## Contributors to this release

## 1.5.12 6.2.0

### 1.5.13 Merged PRs

- Increase minimum tornado version (5933)
- Adjust skip decorators to avoid remaining dependency on nose (5932)
- Ensure that cell ids persist after save (5928)
- Add reconnection to Gateway (form nb2kg) (5924)
- Fix some typos (5917)
- Handle TrashPermissionError, now that it exist (5894)

Thank you to all the contributors:

- @kevin-bates
- @mishaschwartz
- @oyvsyo
- @user202729
- @stefanor

## 1.5.14 6.1.6

### 1.5.15 Merged PRs

- do not require nose for testing (5826)
- [docs] Update Chinese and Hindi readme.md (5823)
- Add support for creating terminals via GET (5813)
- Made doc translations in Hindi and Chinese (5787)

Thank you to all the contributors:

- @pgajdos
- @rjn01
- @kevin-bates
- @virejdasani

## 1.5.16 6.1.5

6.1.5 is a security release, fixing one vulnerability:

- Fix open redirect vulnerability GHSA-c7vm-f5p4-8fqh (CVE to be assigned)

## 1.5.17 6.1.4

- Fix broken links to jupyter documentation (5686)
- Add additional entries to troubleshooting section (5695)
- Revert change in page alignment (5703)
- Bug fix: remove double encoding in download files (5720)
- Fix typo for Check in zh\_CN (5730)
- Require a file name in the “Save As” dialog (5733)

Thank you to all the contributors:

- bdbai
- Jaipreet Singh
- Kevin Bates
- Pavel Panchekha
- Zach Sailer

### 1.5.18 6.1.3

- Title new buttons with label if action undefined (5676)

Thank you to all the contributors:

- Kyle Kelley

### 1.5.19 6.1.2

- Fix russian message format for delete/duplicate actions (5662)
- Remove unnecessary import of bind\_unix\_socket (5666)
- Tooltip style scope fix (5672)

Thank you to all the contributors:

- Dmitry Akatov
- Kevin Bates
- Magda Stenius

### 1.5.20 6.1.1

- Prevent inclusion of requests\_unixsocket on Windows (5650)

Thank you to all the contributors:

- Kevin Bates

### 1.5.21 6.1.0

Please note that this repository is currently maintained by a skeleton crew of maintainers from the Jupyter community. For our approach moving forward, please see this [notice](#) from the README. Thank you.

Here is an enumeration of changes made since the last release and included in 6.1.0.

- Remove deprecated encoding parameter for Python 3.9 compatibility. (5174)
- Add support for async kernel management (4479)
- Fix typo in password\_required help message (5320)
- Gateway only: Ensure launch and request timeouts are in sync (5317)
- Update Markdown Cells example to HTML5 video tag (5411)
- Integrated LoginWidget into edit to enable users to logout from the t... (5406)
- Update message about minimum Tornado version (5222)
- Logged notebook type (5425)
- Added nl language (5354)
- Add UNIX socket support to notebook server. (4835)
- Update CodeMirror dependency (5198)
- Tree added download multiple files (5351)

- [Toolbar buttons tooltip: show help instead of label \(5107\)](#)
- [Remove unnecessary import of requests\\_unixsocket \(5451\)](#)
- [Add ability to cull terminals and track last activity \(5372\)](#)
- [Code refactoring notebook.js \(5352\)](#)
- [Install terminado for docs build \(5462\)](#)
- [Convert notifications JS test to selenium \(5455\)](#)
- [Add cell attachments to markdown example \(5412\)](#)
- [Add Japanese document \(5231\)](#)
- [Migrate Move multiselection test to selenium \(5158\)](#)
- [Use `cmdtrl-enter` to run a cell \(5120\)](#)
- [Fix broken “Raw cell MIME type” dialog \(5385\)](#)
- [Make a notebook writable after successful save-as \(5296\)](#)
- [Add actual watch script \(4738\)](#)
- [Added `--autoreload` flag to `NotebookApp` \(4795\)](#)
- [Enable `check\_origin` on gateway websocket communication \(5471\)](#)
- [Restore detection of missing terminado package \(5465\)](#)
- [Culling: ensure `last\_activity` attr exists before use \(5355\)](#)
- [Added functionality to allow filter kernels by Jupyter Enterprise Gat... \(5484\)](#)
- [‘Play’ icon for run-cell toolbar button \(2922\)](#)
- [Bump minimum version of jQuery to 3.5.0 \(5491\)](#)
- [Remove old JS markdown tests, add a new one in selenium \(5497\)](#)
- [Add support for more RTL languages \(5036\)](#)
- [Make markdown cells stay RTL in edit mode \(5037\)](#)
- [Unforce RTL output display \(5039\)](#)
- [Fixed multicursor backspacing \(4880\)](#)
- [Implemented Split Cell for multicursor \(4824\)](#)
- [Alignment issue \[FIXED\] \(3173\)](#)
- [MathJax: Support for `\gdef` \(4407\)](#)
- [Another \(Minor\) Duplicate Code Reduction \(5316\)](#)
- [Update readme regarding maintenance \(5500\)](#)
- [Document contents chunks \(5508\)](#)
- [Backspace deletes empty line \(5516\)](#)
- [The dropdown submenu at notebook page is not keyboard accessible \(4732\)](#)
- [Tooltips visible through keyboard navigation for specified buttons \(4729\)](#)
- [Fix for recursive symlink \(4670\)](#)
- [Fix for the terminal shutdown issue \(4180\)](#)

- Add japanese translation files (4490)
- Workaround for socket permission errors on Cygwin (4584)
- Implement optional markdown header and footer files (4043)
- Remove double link when using `custom_display_url` (5544)
- Respect `cell.is_editable` during find-and-replace (5545)
- Fix exception causes all over the codebase (5556)
- Improve login shell heuristics (5588)
- Added support for `JUPYTER_TOKEN_FILE` (5587)
- Kill notebook itself when server cull idle kernel (5593)
- Implement password hashing with bcrypt (3793)
- Fix broken links (5600)
- Russian internationalization support (5571)
- Add a metadata tag to override notebook direction (ltr/rtl) (5052)
- Paste two images from clipboard in markdown cell (5598)
- Add keyboard shortcuts to menu dropdowns (5525)
- Update codemirror to 5.56.0+components1 (5637)

Thank you to all the contributors:

### 1.5.22 6.0.3

- Dependency updates to fix startup issues on Windows platform
- Add support for nbconvert 6.x
- Creation of recent tab

Thanks for all the contributors:

- Luciano Resende
- Kevin Bates
- ahangleben
- Zachary Sailer
- Pallavi Bharadwaj
- Thomas Kluyver
- Min RK
- forest0
- Bibo Hao
- Michal Charemza
- Sergey Shevelev
- Shuichiro MAKIGAKI
- krinsman
- TPartida
- Landen McDonald
- Tres DuBiel

### 1.5.23 6.0.2

- Update JQuery dependency to version 3.4.1 to fix security vulnerability (CVE-2019-11358)
- Update CodeMirror to version 5.48.4 to fix Python formatting issues
- Continue removing obsolete Python 2.x code/dependencies
- Multiple documentation updates

Thanks for all the contributors:

- David Robles
- Jason Grout
- Kerwin Sun
- Kevin Bates

- Kyle Kelley
- Luciano Resende
- Marcus D Sherman
- Sasaki Takeru
- Tom Jarosz
- Vidar Tonaas Fauske
- Wes Turner
- Zachary Sailer

### 1.5.24 6.0.1

- Attempt to re-establish websocket connection to Gateway ([4777](#))
- Add missing react-dom.js to package data ([4772](#))

Thanks for all the contributors:

- Eunsoo Park
- Min RK

### 1.5.25 6.0

This is the first major release of the Jupyter Notebook since version 5.0 (March 2017).

We encourage users to start trying JupyterLab, which has just announced it's 1.0 release in preparation for a future transition.

- Remove Python 2.x support in favor of Python 3.5 and higher.
- Multiple accessibility enhancements and bug-fixes.
- Multiple translation enhancements and bug-fixes.
- Remove deprecated ANSI CSS styles.
- Native support to forward requests to Jupyter Gateway(s) (Embedded NB2KG).
- Use JavaScript to redirect users to notebook homepage.
- Enhanced SSL/TLS security by using `PROTOCOL_TLS` which selects the highest ssl/tls protocol version available that both the client and server support. When `PROTOCOL_TLS` is not available use `PROTOCOL_SSLv23`.
- Add `?no_track_activity=1` argument to allow API requests. to not be registered as activity (e.g. API calls by external activity monitors).
- Kernels shutting down due to an idle timeout is no longer considered an activity-updating event.
- Further improve compatibility with tornado 6 with improved checks for when websockets are closed.
- Launch the browser with a local file which redirects to the server address including the authentication token. This prevents another logged-in user from stealing the token from command line arguments and authenticating to the server. The single-use token previously used to mitigate this has been removed. Thanks to Dr. Owain Kenway for suggesting the local file approach.
- Respect nbconvert entrypoints as sources for exporters
- Update to CodeMirror to 5.37, which includes f-string syntax for Python 3.6.

- Update jquery-ui to 1.12
- Execute cells by clicking icon in input prompt.
- New “Save as” menu option.
- When serving on a loopback interface, protect against DNS rebinding by checking the Host header from the browser. This check can be disabled if necessary by setting `NotebookApp.allow_remote_access`. (Disabled by default while we work out some Mac issues in [3754](#)).
- Add `kernel_info_timeout` traitlet to enable restarting slow kernels.
- Add `custom_display_host` config option to override displayed URL.
- Add `/metrics` endpoint for Prometheus Metrics.
- Optimize large file uploads.
- Allow access control headers to be overridden in `jupyter_notebook_config.py` to support greater CORS and proxy configuration flexibility.
- Add support for terminals on windows.
- Add a “restart and run all” button to the toolbar.
- Frontend/extension-config: allow default json files in a `.d` directory.
- Allow setting token via `jupyter_token` env.
- Cull idle kernels using `--MappingKernelManager.cull_idle_timeout`.
- Allow read-only notebooks to be trusted.
- Convert JS tests to Selenium.

Security Fixes included in previous minor releases of Jupyter Notebook and also included in version 6.0.

- Fix Open Redirect vulnerability (CVE-2019-10255) where certain malicious URLs could redirect from the Jupyter login page to a malicious site after a successful login.
- Contains a security fix for a cross-site inclusion (XSSI) vulnerability (CVE-2019-9644), where files at a known URL could be included in a page from an unauthorized website if the user is logged into a Jupyter server. The fix involves setting the `X-Content-Type-Options: nosniff` header, and applying CSRF checks previously on all non-GET API requests to GET requests to API endpoints and the `/files/` endpoint.
- Check Host header to more securely protect localhost deployments from DNS rebinding. This is a pre-emptive measure, not fixing a known vulnerability. Use `.NotebookApp.allow_remote_access` and `.NotebookApp.local_hostnames` to configure access.
- Upgrade bootstrap to 3.4, fixing an XSS vulnerability, which has been assigned [CVE-2018-14041](#).
- Contains a security fix preventing malicious directory names from being able to execute javascript.
- Contains a security fix preventing nbconvert endpoints from executing javascript with access to the server API. CVE request pending.

### 1.5.26 5.7.8

- Fix regression in restarting kernels in 5.7.5. The restart handler would return before restart was completed.
- Further improve compatibility with tornado 6 with improved checks for when websockets are closed.
- Fix regression in 5.7.6 on Windows where .js files could have the wrong mime-type.
- Fix Open Redirect vulnerability (CVE-2019-10255) where certain malicious URLs could redirect from the Jupyter login page to a malicious site after a successful login. 5.7.7 contained only a partial fix for this issue.

### 1.5.27 5.7.6

5.7.6 contains a security fix for a cross-site inclusion (XSSI) vulnerability (CVE-2019-9644), where files at a known URL could be included in a page from an unauthorized website if the user is logged into a Jupyter server. The fix involves setting the `X-Content-Type-Options: nosniff` header, and applying CSRF checks previously on all non-GET API requests to GET requests to API endpoints and the `/files/` endpoint.

The attacking page is able to access some contents of files when using Internet Explorer through script errors, but this has not been demonstrated with other browsers.

### 1.5.28 5.7.5

- Fix compatibility with tornado 6 ([4392](#), [4449](#)).
- Fix opening integer filedescriptor during startup on Python 2 ([4349](#))
- Fix compatibility with asynchronous `[KernelManager.restart_kernel]{.title-ref}` methods ([4412](#))

### 1.5.29 5.7.4

5.7.4 fixes a bug introduced in 5.7.3, in which the `list_running_servers()` function attempts to parse HTML files as JSON, and consequently crashes ([4284](#)).

### 1.5.30 5.7.3

5.7.3 contains one security improvement and one security fix:

- Launch the browser with a local file which redirects to the server address including the authentication token ([4260](#)). This prevents another logged-in user from stealing the token from command line arguments and authenticating to the server. The single-use token previously used to mitigate this has been removed. Thanks to Dr. Owain Kenway for suggesting the local file approach.
- Upgrade bootstrap to 3.4, fixing an XSS vulnerability, which has been assigned [CVE-2018-14041](#) ([4271](#)).

### 1.5.31 5.7.2

5.7.2 contains a security fix preventing malicious directory names from being able to execute javascript. CVE request pending.

### 1.5.32 5.7.1

5.7.1 contains a security fix preventing nbconvert endpoints from executing javascript with access to the server API. CVE request pending.

### 1.5.33 5.7.0

New features:

- Update to CodeMirror to 5.37, which includes f-string syntax for Python 3.6 ([3816](#))
- Update jquery-ui to 1.12 ([3836](#))
- Check Host header to more securely protect localhost deployments from DNS rebinding. This is a pre-emptive measure, not fixing a known vulnerability ([3766](#)). Use `.NotebookApp.allow_remote_access` and `.NotebookApp.local_hostnames` to configure access.
- Allow access-control-allow-headers to be overridden ([3886](#))
- Allow configuring `max_body_size` and `max_buffer_size` ([3829](#))
- Allow configuring `get_secure_cookie` keyword-args ([3778](#))
- Respect nbconvert endpoints as sources for exporters ([3879](#))
- Include translation sources in source distributions ([3925](#), [3931](#))

- Various improvements to documentation ([3799](#), [3800](#), [3806](#), [3883](#), [3908](#))

Fixing problems:

- Fix breadcrumb link when running with a base url ([3905](#))
- Fix possible type error when closing activity stream ([3907](#))
- Disable metadata editing for non-editable cells ([3744](#))
- Fix some styling and alignment of prompts caused by regressions in 5.6.0.
- Enter causing page reload in shortcuts editor ([3871](#))
- Fix uploading to the same file twice ([3712](#))

See the 5.7 milestone on GitHub for a complete list of [pull requests](#) involved in this release.

## 1.5.34 5.6.0

New features:

- Execute cells by clicking icon in input prompt (3535, 3687)
- New “Save as” menu option (3289)
- When serving on a loopback interface, protect against DNS rebinding by checking the Host header from the browser (3714). This check can be disabled if necessary by setting `NotebookApp.allow_remote_access`. (Disabled by default while we work out some Mac issues in 3754).
- Add `kernel_info_timeout` traitlet to enable restarting slow kernels (3665)
- Add `custom_display_host` config option to override displayed URL (3668)
- Add `/metrics` endpoint for Prometheus Metrics (3490)
- Update to MathJax 2.7.4 (3751)
- Update to jQuery 3.3 (3655)
- Update marked to 0.4 (3686)

Fixing problems:

- Don’t duplicate token in displayed URL (3656)
- Clarify displayed URL when listening on all interfaces (3703)
- Don’t trash non-empty directories on Windows (3673)
- Include LICENSE file in wheels (3671)
- Don’t show “0 active kernels” when starting the notebook (3696)

Testing:

- Add find replace test (3630)
- Selenium test for deleting all cells (3601)
- Make creating a new notebook more robust (3726)

Thanks to the following contributors:

- Arovit Narula (arovit)
- lucasoshiro (lucasoshiro)
- M Pacer (mpacer)
- Thomas Kluyver (takluyver)
- Todd (toddrme2178)
- Yuvi Panda (yuvipanda)

See the 5.6 milestone on GitHub for a complete list of [pull requests](#) involved in this release.

### 1.5.35 5.5.0

New features:

- The files list now shows file sizes (3539)
- Add a quit button in the dashboard (3004)
- Display hostname in the terminal when running remotely (3356, 3593)
- Add slides exportation/download to the menu (3287)
- Add any extra installed nbconvert exporters to the “Download as” menu (3323)
- Editor: warning when overwriting a file that is modified on disk (2783)
- Display a warning message if cookies are not enabled (3511)
- Basic `__version__` reporting for extensions (3541)
- Add `NotebookApp.terminals_enabled` config option (3478)
- Make buffer time between last modified on disk and last modified on last save configurable (3273)
- Allow binding custom shortcuts for ‘close and halt’ (3314)
- Add description for ‘Trusted’ notification (3386)
- Add `settings['activity_sources']` (3401)
- Add an `output_updated.OutputArea` event (3560)

Fixing problems:

- Fixes to improve web accessibility (3507)
- Fixed color contrast issue in `tree.less` (3336)
- Allow cancelling upload of large files (3373)
- Don’t clear login cookie on requests without cookie (3380)
- Don’t trash files on different device to home dir on Linux (3304)
- Clear waiting asterisks when restarting kernel (3494)
- Fix output prompt when `execution_count` missing (3236)
- Make the ‘changed on disk’ dialog work when displayed twice (3589)
- Fix going back to root directory with history in notebook list (3411)
- Allow defining keyboard shortcuts for missing actions (3561)
- Prevent default on pageup/pagedown when completer is active (3500)
- Prevent default event handling on new terminal (3497)
- `ConfigManager` should not write out default values found in the `.d` directory (3485)
- Fix leak of `iopub` object in activity monitoring (3424)
- Javascript lint in `notebooklist.js` (3409)
- Some Javascript syntax fixes (3294)
- Convert native for loop to `Array.forEach()` (3477)
- Disable cache when downloading nbconvert output (3484)
- Add missing `digestmod` arg to `HMAC` (3399)

- Log OSErrors failing to create less-critical files during startup (3384)
- Use powershell on Windows (3379)
- API spec improvements, API handler improvements (3368)
- Set notebook to dirty state after change to kernel metadata (3350)
- Use CSP header to treat served files as belonging to a separate origin (3341)
- Don't install gettext into builtins (3330)
- Add missing `import _` (3316, 3326)
- Write `notebook.json` file atomically (3305)
- Fix clicking with modifiers, page title updates (3282)
- Upgrade jQuery to version 2.2 (3428)
- Upgrade xterm.js to 3.1.0 (3189)
- Upgrade moment.js to 2.19.3 (3562)
- Upgrade CodeMirror to 5.35 (3372)
- "Require" `pyzmq>=17` (3586)

### Documentation:

- Documentation updates and organisation (3584)
- Add section in docs about privacy (3571)
- Add explanation on how to change the type of a cell to Markdown (3377)
- Update docs with confd implementation details (3520)
- Add more information for where `jupyter_notebook_config.py` is located (3346)
- Document options to enable nbextensions in specific sections (3525)
- jQuery attribute selector value MUST be surrounded by quotes (3527)
- Do not execute special notebooks with nbsphinx (3360)
- Other minor fixes in 3288, 3528, 3293, 3367

### Testing:

- Testing with Selenium & Sauce labs (3321)
- Selenium utils + markdown rendering tests (3458)
- Convert insert cell tests to Selenium (3508)
- Convert prompt numbers tests to Selenium (3554)
- Convert delete cells tests to Selenium (3465)
- Convert undelete cell tests to Selenium (3475)
- More selenium testing utilities (3412)
- Only check links when build is trigger by Travis Cron job (3493)
- Fix Appveyor build errors (3430)
- Undo patches in teardown before attempting to delete files (3459)
- Get tests running with tornado 5 (3398)

- Unpin ipykernel version on Travis ([3223](#))

Thanks to the following contributors:

See the 5.5 milestone on GitHub for a complete list of [pull requests](#) involved in this release.

### 1.5.36 5.4.1

A security release to fix [CVE-2018-8768](#).

Thanks to [Alex](#) for identifying this bug, and Jonathan Kamens and Scott Sanderson at Quantopian for verifying it and bringing it to our attention.

### 1.5.37 5.4.0

- Fix creating files and folders after navigating directories in the dashboard ([3264](#)).
- Enable printing notebooks in colour, removing the CSS that made everything black and white ([3212](#)).
- Limit the completion options displayed in the notebook to 1000, to avoid performance issues with very long lists ([3195](#)).
- Accessibility improvements in `tree.html` ([3271](#)).
- Added alt-text to the kernel logo image in the notebook UI ([3228](#)).
- Added a test on Travis CI to flag if symlinks are accidentally introduced in the future. This should prevent the issue that necessitated `release-5.3.1{.interpreted-text role="ref"}` ([3227](#)).
- Use lowercase letters for random IDs generated in our Javascript ([3264](#)).
- Removed duplicate code setting `TextCell.notebook` ([3256](#)).

Thanks to the following contributors:

- Alex Soderman ([asoderman](#))
- Matthias Bussonnier ([Carreau](#))
- Min RK ([minrk](#))
- Nitesh Sawant ([ns23](#))
- Thomas Kluyver ([takluyver](#))
- Yuvi Panda ([yuvipanda](#))

See the 5.4 milestone on GitHub for a complete list of [pull requests](#) involved in this release.

### 1.5.38 5.3.1

Replaced a symlink in the repository with a copy, to fix issues installing on Windows ([3220](#)).

### 1.5.39 5.3.0

This release introduces a couple notable improvements, such as terminal support for Windows and support for OS trash (files deleted from the notebook dashboard are moved to the OS trash vs. deleted permanently).

- Add support for terminals on windows (3087).
- Add a “restart and run all” button to the toolbar (2965).
- Send files to os trash mechanism on delete (1968).
- Allow programmatic copy to clipboard (3088).
- Use DOM History API for navigating between directories in the file browser (3115).
- Add translated files to folder(docs-translations) (3065).
- Allow non empty dirs to be deleted (3108).
- Set cookie on base\_url (2959).
- Allow token-authenticated requests cross-origin by default (2920).
- Change cull\_idle\_timeout\_minimum to 1 from 300 (2910).
- Config option to shut down server after n seconds with no kernels (2963).
- Display a “close” button on load notebook error (3176).
- Add action to command palette to run CodeMirror’s “indentAuto” on selection (3175).
- Add option to specify extra services (3158).
- Warn\_bad\_name should not use global name (3160).
- Avoid overflow of hidden form (3148).
- Fix shutdown trans loss (3147).
- Find available kernelspecs more efficiently (3136).
- Don’t try to translate missing help strings (3122).
- Frontend/extension-config: allow default json files in a .d directory (3116).
- Use [requirejs]{.title-ref} vs. [require]{.title-ref} (3097).
- Fixes some ui bugs in firefox #3044 (3058).
- Compare non-specific language code when choosing to use arabic numerals (3055).
- Fix save-script deprecation (3053).
- Include moment locales in package\_data (3051).
- Fix moment locale loading in bidi support (3048).
- Tornado 5: periodiccallback loop arg will be removed (3034).
- Use [/files]{.title-ref} prefix for pdf-like files (3031).
- Add folder for document translation (3022).
- When login-in via token, let a chance for user to set the password (3008).
- Switch to jupyter\_core implementation of ensure\_dir\_exists (3002).
- Send http shutdown request on ‘stop’ subcommand (3000).
- Work on loading ui translations (2969).

- Fix ansi inverse (2967).
- Add send2trash to requirements for building docs (2964).
- I18n readme.md improvement (2962).
- Add 'reason' field to json error responses (2958).
- Add some padding for stream outputs (3194).
- Always use setuptools in `setup.py` (3206).
- Fix clearing cookies on logout when `base_url` is configured (3207).

- PHaeJin (PHaeJin)
- Sukneet (Sukneet)
- Thomas Kluyver (takluyver)

See the 5.3 milestone on GitHub for a complete list of [pull requests](#) involved in this release.

### 1.5.40 5.2.1

- Fix invisible CodeMirror cursor at specific browser zoom levels (2983).
- Fix nbconvert handler causing broken export to PDF (2981).
- Fix the prompt\_area argument of the output area constructor. (2961).
- Handle a compound extension in newUntitled (2949).
- Allow disabling offline message buffering (2916).

Thanks to the following contributors:

- Steven Silvester ([blink1073](#))
- Grant Nestor ([gnestor](#))
- Jason Grout ([jasongrout](#))
- Min RK ([minrk](#))
- M Pacer ([mpacer](#))

See the 5.2.1 milestone on GitHub for a complete list of [pull requests](#) involved in this release.

### 1.5.41 5.2.0

- Allow setting token via jupyter\_token env (2921).
- Fix some errors caused by raising 403 in get\_current\_user (2919).
- Register contents\_manager.files\_handler\_class directly (2917).
- Update viewable\_extensions (2913).
- Show edit shortcuts modal after shortcuts modal is hidden (2912).
- Improve edit/view behavior (2911).
- The root directory of the notebook server should never be hidden (2907).
- Fix notebook require config to match tools/build-main (2888).
- Give page constructor default arguments (2887).
- Fix codemirror.less to match codemirror's expected padding layout (2880).
- Add x-xsrftoken to access-control-allow-headers (2876).
- Buffer messages when websocket connection is interrupted (2871).
- Load locale dynamically only when not en-us (2866).
- Changed key strength to 2048 bits (2861).
- Resync jsversion with python version (2860).
- Allow copy operation on modified, read-only notebook (2854).
- Update error handling on apihandlers (2853).
- Test python 3.6 on travis, drop 3.3 (2852).
- Avoid base64-literals in image tests (2851).
- Upgrade xterm.js to 2.9.2 (2849).

- Changed all python variables named file to file\_name to not override built\_in file (2830).
- Add more doc tests (2823).
- Typos fix (2815).
- Rename and update license [ci skip] (2810).
- Travis builds doc (2808).
- Pull request i18n (2804).
- Factor out output\_prompt\_function, as is done with input prompt (2774).
- Use rfc5987 encoding for filenames (2767).
- Added path to the resources metadata, the same as in from\_filename(...) in nbconvert.exporters.py (2753).
- Make “extrakeys” consistent for notebook and editor (2745).
- Bidi support (2357).

Special thanks to [samarsultan](#) and the Arabic Competence and Globalization Center Team at IBM Egypt for adding RTL (right-to-left) support to the notebook!

See the 5.2 milestone on GitHub for a complete list of [issues](#) and [pull requests](#) involved in this release.

### 1.5.42 5.1.0

- Preliminary i18n implementation (2140).
- Expose URL with auth token in notebook UI (2666).
- Fix search background style (2387).
- List running notebooks without requiring --allow-root (2421).
- Allow session of type other than notebook (2559).
- Fix search background style (2387).
- Fix some Markdown styling issues (2571), (2691) and (2534).
- Remove keymaps that conflict with non-English keyboards (2535).
- Add session-specific favicons (notebook, terminal, file) (2452).
- Add /api/shutdown handler (2507).
- Include metadata when copying a cell (2349).
- Stop notebook server from command line (2388).
- Improve “View” and “Edit” file handling in dashboard (2449) and (2402).
- Provide a promise to replace use of the app\_initialized.NotebookApp event (2710).
- Fix disabled collapse/expand output button (2681).
- Cull idle kernels using --MappingKernelManager.cull\_idle\_timeout (2215).
- Allow read-only notebooks to be trusted (2718).

See the 5.1 milestone on GitHub for a complete list of [issues](#) and [pull requests](#) involved in this release.

### 1.5.43 5.0.0

This is the first major release of the Jupyter Notebook since version 4.0 was created by the “Big Split” of IPython and Jupyter.

We encourage users to start trying JupyterLab in preparation for a future transition.

We have merged more than 300 pull requests since 4.0. Some of the major user-facing changes are described here.

#### File sorting in the dashboard

Files in the dashboard may now be sorted by last modified date or name (943):

#### Cell tags

There is a new cell toolbar for adding *cell tags* (2048):

Cell tags are a lightweight way to customise the behaviour of tools working with notebooks; we’re working on building support for them into tools like `nbconvert` and `nbval`. To start using tags, select Tags in the View > Cell Toolbar menu in a notebook.

The UI for editing cell tags is basic for now; we hope to improve it in future releases.

#### Table style

The default styling for tables in the notebook has been updated (1776).

#### Customise keyboard shortcuts

You can now edit keyboard shortcuts for *Command Mode* within the UI (1347):

See the Help > Edit Keyboard Shortcuts menu item and follow the instructions.

#### Other additions

- You can copy and paste cells between notebooks, using `Ctrl-C`{.interpreted-text role="kbd"} and `Ctrl-V`{.interpreted-text role="kbd"} (Cmd-C{.interpreted-text role="kbd"} and Cmd-V{.interpreted-text role="kbd"} on Mac).
- It’s easier to configure a password for the notebook with the new `jupyter notebook password` command (2007).
- The file list can now be ordered by *last modified* or by *name* (943).
- Markdown cells now support attachments. Simply drag and drop an image from your desktop to a markdown cell to add it. Unlike relative links that you enter manually, attachments are embedded in the notebook itself. An unreferenced attachment will be automatically scrubbed from the notebook on save (621).
- Undoing cell deletion now supports undeleting multiple cells. Cells may not be in the same order as before their deletion, depending on the actions you did on the meantime, but this should help reduce the impact of accidentally deleting code.
- The file browser now has *Edit* and *View* buttons.
- The file browser now supports moving multiple files at once (1088).

- The Notebook will refuse to run as root unless the `--allow-root` flag is given (1115).
- Keyboard shortcuts are now declarative (1234).
- Toggling line numbers can now affect all cells (1312).
- Add more visible *Trusted* and *Untrusted* notifications (1658).
- The favicon (browser shortcut icon) now changes to indicate when the kernel is busy (1837).
- Header and toolbar visibility is now persisted in nbconfig and across sessions (1769).
- Load server extensions with ConfigManager so that merge happens recursively, unlike normal config values, to make it load more consistently with frontend extensions(2108).
- The notebook server now supports the bundler API from the `jupyter_cms` incubator project (1579).
- The notebook server now provides information about kernel activity in its kernel resource API (1827).

Remember that upgrading notebook only affects the user interface. Upgrading kernels and libraries may also provide new features, better stability and integration with the notebook interface.

#### 1.5.44 4.4.0

- Allow override of output callbacks to redirect output messages. This is used to implement the ipywidgets Output widget, for example.
- Fix an async bug in message handling by allowing comm message handlers to return a promise which halts message processing until the promise resolves.

See the 4.4 milestone on GitHub for a complete list of [issues](#) and [pull requests](#) involved in this release.

#### 1.5.45 4.3.2

4.3.2 is a patch release with a bug fix for CodeMirror and improved handling of the “editable” cell metadata field.

- Monkey-patch for CodeMirror that resolves [#2037](#) without breaking [#1967](#)
- Read-only (`"editable": false`) cells can be executed but cannot be split, merged, or deleted

See the 4.3.2 milestone on GitHub for a complete list of [issues](#) and [pull requests](#) involved in this release.

#### 1.5.46 4.3.1

4.3.1 is a patch release with a security patch, a couple bug fixes, and improvements to the newly-released token authentication.

##### Security fix:

- CVE-2016-9971. Fix CSRF vulnerability, where malicious forms could create untitled files and start kernels (no remote execution or modification of existing files) for users of certain browsers (Firefox, Internet Explorer / Edge). All previous notebook releases are affected.

##### Bug fixes:

- Fix carriage return handling
- Make the font size more robust against fickle browsers
- Ignore resize events that bubbled up and didn’t come from window
- Add Authorization to allowed CORS headers

- Downgrade CodeMirror to 5.16 while we figure out issues in Safari

Other improvements:

- Better docs for token-based authentication
- Further highlight token info in log output when autogenerated

See the 4.3.1 milestone on GitHub for a complete list of [issues](#) and [pull requests](#) involved in this release.

## 1.5.47 4.3.0

4.3 is a minor release with many bug fixes and improvements. The biggest user-facing change is the addition of token authentication, which is enabled by default. A token is generated and used when your browser is opened automatically, so you shouldn't have to enter anything in the default circumstances. If you see a login page (e.g. by switching browsers, or launching on a new port with `--no-browser`), you get a login URL with the token from the command `jupyter notebook list`, which you can paste into your browser.

Highlights:

- API for creating mime-type based renderer extensions using `OutputArea.register_mime_type` and `Notebook.render_cell_output` methods. See [mimerender-cookiecutter](#) for reference implementations and cookiecutter.
- Enable token authentication by default. See `server_security{.interpreted-text role="ref"}` for more details.
- Update security docs to reflect new signature system
- Switched from `term.js` to `xterm.js`

Bug fixes:

- Ensure variable is set if `exc_info` is falsey
- Catch and log handler exceptions in `events.trigger`
- Add debug log for static file paths
- Don't check origin on token-authenticated requests
- Remove leftover print statement
- Fix highlighting of Python code blocks
- `json_errors` should be outermost decorator on API handlers
- Fix remove old nbserver info files
- Fix notebook mime type on download links
- Fix carriage symbol behavior
- Fix terminal styles
- Update dead links in docs
- If kernel is broken, start a new session
- Include cross-origin check when allowing login URL redirects

Other improvements:

- Allow JSON output data with mime type `application/*+json`
- Allow kernelspecs to have spaces in them for backward compat
- Allow websocket connections from scripts

- Allow None for post\_save\_hook
- Upgrade CodeMirror to 5.21
- Upgrade xterm to 2.1.0
- Docs for using comms
- Set dirty flag when output arrives
- Set ws-url data attribute when accessing a notebook terminal
- Add base aliases for nbextensions
- Include @ operator in CodeMirror IPython mode
- Extend mathjax\_url docstring
- Load nbextension in predictable order
- Improve the error messages for nbextensions
- Include cross-origin check when allowing login URL redirects

See the 4.3 milestone on GitHub for a complete list of [issues](#) and [pull requests](#) involved in this release.

## 1.5.48 4.2.3

4.2.3 is a small bugfix release on 4.2.

Highlights:

- Fix regression in 4.2.2 that delayed loading custom.js until after notebook\_loaded and app\_initialized events have fired.
- Fix some outdated docs and links.

## 1.5.49 4.2.2

4.2.2 is a small bugfix release on 4.2, with an important security fix. All users are strongly encouraged to upgrade to 4.2.2.

Highlights:

- **Security fix:** CVE-2016-6524, where untrusted latex output could be added to the page in a way that could execute javascript.
- Fix missing POST in OPTIONS responses.
- Fix for downloading non-ascii filenames.
- Avoid clobbering ssl\_options, so that users can specify more detailed SSL configuration.
- Fix inverted load order in nbconfig, so user config has highest priority.
- Improved error messages here and there.

### 1.5.50 4.2.1

4.2.1 is a small bugfix release on 4.2. Highlights:

- Compatibility fixes for some versions of ipywidgets
- Fix for ignored CSS on Windows
- Fix specifying destination when installing nbextensions

### 1.5.51 4.2.0

Release 4.2 adds a new API for enabling and installing extensions. Extensions can now be enabled at the system-level, rather than just per-user. An API is defined for installing directly from a Python package, as well.

Highlighted changes:

- Upgrade MathJax to 2.6 to fix vertical-bar appearing on some equations.
- Restore ability for notebook directory to be root (4.1 regression)
- Large outputs are now throttled, reducing the ability of output floods to kill the browser.
- Fix the notebook ignoring cell executions while a kernel is starting by queueing the messages.
- Fix handling of url prefixes (e.g. JupyterHub) in terminal and edit pages.
- Support nested SVGs in output.

And various other fixes and improvements.

### 1.5.52 4.1.0

Bug fixes:

- Properly reap zombie subprocesses
- Fix cross-origin problems
- Fix double-escaping of the base URL prefix
- Handle invalid unicode filenames more gracefully
- Fix ANSI color-processing
- Send keepalive messages for web terminals
- Fix bugs in the notebook tour

UI changes:

- Moved the cell toolbar selector into the *View* menu. Added a button that triggers a “hint” animation to the main toolbar so users can find the new location. (Click here to see a [screencast](#) )
- Added *Restart & Run All* to the *Kernel* menu. Users can also bind it to a keyboard shortcut on action `restart-kernel-and-run-all-cells`.
- Added multiple-cell selection. Users press `Shift-Up/Down` or `Shift-K/J` to extend selection in command mode. Various actions such as cut/copy/paste, execute, and cell type conversions apply to all selected cells.
- Added a command palette for executing Jupyter actions by name. Users press `Cmd/Ctrl-Shift-P` or click the new command palette icon on the toolbar.
- Added a *Find and Replace* dialog to the *Edit* menu. Users can also press `F` in command mode to show the dialog.

Other improvements:

- Custom KernelManager methods can be Tornado coroutines, allowing async operations.
- Make clearing output optional when rewriting input with `set_next_input(replace=True)`.
- Added support for TLS client authentication via `--NotebookApp.client-ca`.
- Added tags to jupyter/notebook releases on DockerHub. `latest` continues to track the master branch.

See the 4.1 milestone on GitHub for a complete list of [issues](#) and [pull requests](#) handled.

### 1.5.53 4.0.x

#### 4.0.6

- fix installation of mathjax support files
- fix some double-escape regressions in 4.0.5
- fix a couple of cases where errors could prevent opening a notebook

#### 4.0.5

Security fixes for maliciously crafted files.

- [CVE-2015-6938](#): malicious filenames
- [CVE-2015-7337](#): malicious binary files in text editor.

Thanks to Jonathan Kamens at Quantopian and Juan Broullón for the reports.

#### 4.0.4

- Fix inclusion of mathjax-safe extension

#### 4.0.2

- Fix launching the notebook on Windows
- Fix the path searched for frontend config

#### 4.0.0

First release of the notebook as a standalone package.

## CONFIGURATION

### 2.1 Configuration Overview

Beyond the default configuration settings, you can configure a rich array of options to suit your workflow. Here are areas that are commonly configured when using Jupyter Notebook:

- *Jupyter's common configuration system*
- *Jupyter Server*
- *Notebook extensions*

Let's look at highlights of each area.

#### 2.1.1 Jupyter's Common Configuration system

Jupyter applications, from the Notebook to JupyterHub to nbgrader, share a common configuration system. The process for creating a configuration file and editing settings is similar for all the Jupyter applications.

- [Jupyter's Common Configuration Approach](#)
- [Common Directories and File Locations](#)
- [Language kernels](#)
- [traitlets](#) provide a low-level architecture for configuration.

#### 2.1.2 Jupyter server

The Jupyter Server runs the language kernel and communicates with the front-end Notebook client (i.e. the familiar notebook interface).

- [Configuring the Jupyter Server](#)

To create a `jupyter_server_config.py` file in the `.jupyter` directory, with all the defaults commented out, use the following command:

```
$ jupyter server --generate-config
```

- [Running a Jupyter Server](#)
- [Related: Configuring a language kernel](#) to run in the Jupyter Server enables your server to run other languages, like R or Julia.

### 2.1.3 Notebook extensions

The Notebook frontend can be extended with JupyterLab extensions.

See the *Frontend Extension Guide* for more information.

**Security in Jupyter notebooks:** Since security policies vary from organization to organization, we encourage you to consult with your security team on settings that would be best for your use cases. Our documentation offers some responsible security practices, and we recommend becoming familiar with the practices.

## 2.2 Extending the Notebook

Certain subsystems of the notebook server are designed to be extended or overridden by users. These documents explain these systems, and show how to override the notebook's defaults with your own custom behavior.

### 2.2.1 Custom front-end extensions

This describes the basic steps to write a TypeScript extension for the Jupyter notebook front-end. This allows you to customize the behaviour of the various pages like the dashboard, the notebook, or the text editor.

Starting with Notebook v7, front-end extensions for the notebook can be developed as prebuilt JupyterLab extensions.

This means Notebook v7 is able to reuse many of the existing extensions from the JupyterLab ecosystem as is.

If you would like to develop a prebuilt extension for Notebook v7, check out:

- [JupyterLab Extension Tutorial](#): A tutorial to learn how to make a simple JupyterLab extension.
- [The JupyterLab Extension Examples Repository](#): A short tutorial series to learn how to develop extensions for JupyterLab by example.

## CONTRIBUTOR

### 3.1 Contributing to Jupyter Notebook

Thanks for contributing to Jupyter Notebook!

Make sure to follow [Project Jupyter's Code of Conduct](#) for a friendly and welcoming collaborative environment.

#### 3.1.1 Setting up a development environment

Note: You will need NodeJS to build the extension package.

The `jlpm` command is JupyterLab's pinned version of `yarn` that is installed with JupyterLab. You may use `yarn` or `npm` in lieu of `jlpm` below.

**Note:** we recommend using `mamba` to speed the creating of the environment.

```
# create a new environment
mamba create -n notebook -c conda-forge python nodejs -y

# activate the environment
mamba activate notebook

# Install package in development mode
pip install -e .

# Link the notebook extension and @jupyter-notebook schemas
jlpm develop

# Enable the server extension
jupyter server extension enable notebook
```

`notebook` follows a monorepo structure. To build all the packages at once:

```
jlpm build
```

There is also a `watch` script to watch for changes and rebuild the app automatically:

```
jlpm watch
```

To make sure the `notebook` server extension is installed:

```
$ jupyter server extension list
Config dir: /home/username/.jupyter

Config dir: /home/username/miniforge3/envs/notebook/etc/jupyter
  jupyterlab enabled
    - Validating jupyterlab...
      jupyterlab 3.0.0 OK
  notebook enabled
    - Validating notebook...
      notebook 7.0.0a0 OK

Config dir: /usr/local/etc/jupyter
```

Then start Jupyter Notebook with:

```
jupyter notebook
```

### 3.1.2 Running Tests

To run the tests:

```
jlpm run build:test
jlpm run test
```

There are also end to end tests to cover higher level user interactions, located in the `ui-tests` folder. To run these tests:

```
cd ui-tests
# start a new Jupyter server in a terminal
jlpm start

# in a new terminal, run the tests
jlpm test
```

The test script calls the Playwright test runner. You can pass additional arguments to `playwright` by appending parameters to the command. For example to run the test in headed mode, `jlpm test --headed`.

Checkout the [Playwright Command Line Reference](#) for more information about the available command line options.

Running the end to end tests in headful mode will trigger something like the following:

### 3.1.3 Code Styling

All non-python source code is formatted using `prettier` and python source code is formatted using `blacks`. When code is modified and committed, all staged files will be automatically formatted using pre-commit git hooks (with help from `pre-commit`). The benefit of using a code formatters like `prettier` and `black` is that it removes the topic of code style from the conversation when reviewing pull requests, thereby speeding up the review process.

As long as your code is valid, the pre-commit hook should take care of how it should look. `pre-commit` and its associated hooks will automatically be installed when you run `pip install -e "[test]"`

To install `pre-commit` manually, run the following:

```
pip install pre-commit
pre-commit install
```

You can invoke the pre-commit hook by hand at any time with:

```
pre-commit run
```

which should run any autoformatting on your code and tell you about any errors it couldn't fix automatically. You may also install [black integration](#) into your text editor to format code automatically.

If you have already committed files before setting up the pre-commit hook with `pre-commit install`, you can fix everything up using `pre-commit run --all-files`. You need to make the fixing commit yourself after that.

You may also use the prettier npm script (e.g. `npm run prettier` or `yarn prettier` or `jlpm prettier`) to format the entire code base. We recommend installing a prettier extension for your code editor and configuring it to format your code with a keyboard shortcut or automatically on save.

## 3.2 Developer FAQ

1. How do I install a prerelease version such as a beta or release candidate?

```
python -m pip install notebook --pre --upgrade
```
